# 1 Introduction

Tatham Engineering Limited was retained by Nivas Development Ltd. to conduct a Traffic Impact Study in support of the proposed mixed-use development to be located at 101 Main Street East in the community of Markdale, Municipality of Grey Highlands. The location of the development site is illustrated in Figure 1.

## 1.1 STUDY PURPOSE

The purpose of this study is to address the requirements of the Municipality of Grey Highlands and County of Grey with respect to the potential transportation impacts of the development on the area road network. In particular, the following will be discussed:

- the operations of the road system through the study area prior to the proposed development;
- the growth in the traffic volumes not otherwise attributed to the development (i.e. from overall growth in the area and/or other developments);
- the number of new trips the proposed development is likely to generate;
- the operations of the study area road system upon completion of the development; and
- the resulting impacts and need for mitigating measures (if required) to ensure acceptable overall road operations.

## 1.2 STUDY STRUCTURE

The report is structured as follows:

- Chapter 1: introduction and study purpose;
- Chapter 2: existing conditions, detailing the road system and corresponding traffic operations;
- Chapter 3: future conditions, prior to the completion of the proposed development (referred to as future background conditions), and the expected growth in traffic levels and the resulting operating conditions;
- Chapter 4: proposed development and associated details including land use, access, traffic volumes and parking;
- Chapter 5: future conditions, with completion of the proposed development (referred to as future total conditions); and
- Chapter 6: summary of the report and key findings.

## 2 Existing Conditions

This chapter will discuss the road network, traffic volumes, and operations under the existing conditions.

### 2.1 ROAD NETWORK

The road network to be addressed by this study consists of Toronto Street, Main Street, Herbert Avenue, Victoria Avenue, Uplands Drive, Lawler Drive and the following intersections:

- Main Street & Toronto Street;
- Main Street East & Herbert Avenue;
- Main Street East & Lawler Drive;
- Toronto Street South & Victoria Avenue; and
- Toronto Street South & Uplands Drive.

For the purposes of this report, Toronto Street, Herbert Avenue, and Lawler Drive are considered oriented north-south (maintaining consistency with local road naming conventions), whereas the remaining roads are considered oriented east-west.

Aerial imagery of the study area road network and key intersections are provided in Figure 2 and Figure 3.

#### 2.1.1 Road Sections

##### **Toronto Street (Highway 10)**

Toronto Street (Highway 10) is part of the provincial highway system; however, through Markdale the road falls under the jurisdiction of the Municipality as part of the MTO Connecting Links program. Toronto Street has a 2-lane urban cross-section (i.e. curb and gutter) providing 1 through lane per direction with on-street parking on both sides of the road near its intersection with Main Street (i.e. the downtown area of Markdale).

##### **Main Street (Grey Road 12)**

Main Street (Grey Road 12) is a County road with an urban cross-section west of Cambrai Road and a rural cross-section (i.e. gravel shoulders and open ditches) east of Cambrai Road. Main Street accommodates 1 travel lane per direction with on-street parking on both sides of the road in the vicinity of its intersection with Toronto Street (i.e. near the downtown).

### **Herbert Avenue**

Herbert Avenue is a 2-lane local road with an urban cross section providing 1 travel lane per direction. The road has a length of approximately 200 metres, serving approximately 15 detached residential units and terminating in a T-intersection at Main Street. Herbert Avenue will be extended to the south to serve the approved Centre Point South subdivision as development occurs (see Section 3.2.2).

### **Victoria Avenue**

Victoria Avenue is a 2-lane local road with an urban cross-section providing one travel lane per direction. The road services a residential neighbourhood to the west of Toronto Street South and a commercial development to the east of Toronto Street South, terminating at a dead-end approximately 175 metres east of Toronto Street South. Victoria Avenue will be extended farther east as the Centre Point South subdivision is developed.

### **Uplands Drive**

Uplands Drive is a 2-lane local road with an urban cross-section providing one travel lane per direction and terminating at Toronto Street with a T-intersection. The road has a length of approximately 175 metres, serving in the order of 20 residences (including those along Clugston Drive to which it provides access). Similar to Victoria Avenue, Uplands Drive will be extended easterly to serve the Centre Point South residential development.

### **Lawler Drive**

Lawler Drive is a 2-lane local road with a rural cross-section providing one lane of travel per direction. The road services a residential neighbourhood north of Main Street and terminates in a T-intersection at Main Street.

### **Speed Limits**

Aside from Toronto Street and Main Street (both of which have posted speed limits of 50 km/h through the study area), the remaining roads in the network are unposted. Given the location within the built-up area of Markdale and the local function of the subject roads, a speed limit of 50 km/h and a design speed of 60 km/h have been assumed (posted speed limit + 10 km/h for lower-speed roads).

#### **2.1.2 Key Intersections**

The key intersections are illustrated in Figure 3 with additional details provided in Table 1. In most cases, the approaches to each intersection are single, shared lanes (no dedicated left and/or right turn lanes). The exceptions to this are the north and south approaches at the

intersection of Toronto Street South with Victoria Street and the north approach at the intersection of Toronto Street South with Uplands Drive, each of which provide a dedicated left turn lane.

**Table 1: Key Intersection Configuration & Control**

<b>INTERSECTION</b>	<b>INTERSECTION APPROACH CONFIGURATION</b>				<b>CONTROL</b>

## 2.2 TRAFFIC VOLUMES

### 2.2.1 Traffic Counts

To determine existing traffic volumes, turning movement counts were conducted at the key intersections along Main Street and Toronto Street on Thursday March 31, 2022, from 7:00 to 10:00 and 15:00 to 18:00. The observed volumes are illustrated in Figure 4 with detailed count sheets provided in Appendix A.

### 2.2.2 Seasonal Adjustments - Summer

The MTO publishes annual average daily traffic (AADT) and summer average daily traffic (SADT), volumes for all provincial highways<sup>1</sup>. Data pertaining to the sections of Highway 10 immediately north and south of Markdale for the period 2011 to 2016 (which is the latest published year) is provided in Table 2, including the ratio of summer to average daily traffic volumes.

---

<sup>1</sup> Provincial Highways Traffic Volumes 1988-2016. Ministry of Transportation of Ontario.

**Table 2: Highway 10 Traffic Volumes**

YEAR	NORTH OF MARKDALE			SOUTH OF MARKDALE		
	AADT	SADT	Ratio	AADT	SADT	Ratio
2011	5,400	6,450	1.19	6,300	7,500	1.19
2012	4,850	6,550	1.35	6,200	7,350	1.19
2013	4,900	6,550	1.34	6,200	8,300	1.34
2014	5,500	7,400	1.35	6,200	8,300	1.34
2015	5,500	7,350	1.34	6,900	9,250	1.34
2016	5,550	7,450	1.34	7,000	9,350	1.34
<b>average</b>			<b>1.32</b>			<b>1.29</b>

As indicated, the summer average daily volumes on both sections of Highway 10 ranged from 19% to 35% greater than the annual average daily volumes.

In considering the noted seasonal data, a seasonal adjustment factor of 1.3 was applied to the observed through volumes along Toronto Street and Main Street to approximate summer conditions. This is somewhat less than the noted average, however it is recognized that overall increases in daily volumes do not necessarily mean equally large increases to peak hour volumes (i.e. non-peak times experience proportionally more additional traffic than peak times). The observed volumes on the local roads were not adjusted as these roads serve local traffic and are not otherwise subject to seasonal variations.

### 2.2.3 Adjusted Traffic Volumes

The resulting 2022 adjusted traffic volumes are illustrated in Figure 5.

## 2.3 TRAFFIC OPERATIONS

The assessment of existing conditions provides the baseline from which the future traffic operations (both with and without the subject development) can be assessed from. The capacity, and hence operations, of a road system is effectively governed by its intersections. The analysis is based on the 2022 adjusted traffic volumes, the existing intersection configuration and control,

and procedures outlined in the *2000 Highway Capacity Manual*<sup>2</sup> (using Synchro v.11 software). For signalized intersections, the analysis considers:

- the average delay (measured in seconds);
- level of service (LOS); and
- volume to capacity (v/c) for each signalized movement.

For unsignalized intersections, the analysis considers the same metrics but focuses on critical movements only, namely stop controlled movements on the minor road.

With respect to the noted metrics:

- level of service 'A' corresponds to the best operating condition with minimal delays whereas level of service 'F' corresponds to poor operations resulting from high intersection delays (additional details regarding Level of Service definitions are provided in Appendix B); and
- a v/c ratio of less than 1.0 indicates the intersection movement/approach is operating at less than capacity while v/c of 1.0 indicates capacity has been reached.

A summary of operations for each intersection is provided in Table 3, with detailed worksheets provided in Appendix C. As shown, all intersections are currently providing excellent operations (LOS C or better) with significant reserve capacity remaining (v/c of 0.59 or less) and thus no improvements are required to accommodate the existing volumes.

---

# 3 Future Background Conditions

This chapter will describe the road network and background traffic volumes expected for the years 2027, 2032 and 2037. The 2027 horizon year has been adopted to reflect full build-out of the proposed development, while the 2032 and 2037 horizons will address the longer-term impacts of the development (5 and 10 years beyond build-out).

## 3.1 ROAD NETWORK

### 3.1.1 Upper Tier Network

Per the *Grey County Transportation Master Plan*<sup>3</sup>, no upgrades are currently planned for Main Street (Grey Road 12) through Markdale, nor does the Municipality or MTO have any planned improvements for Toronto Street (Highway 10). As such, the configurations for these roads as described in Section 2.1.1 have been maintained in the assessment.

### 3.1.2 Local Network

As previously noted, the development of the Centre Point South subdivision (see Section 3.2.2) will result in several new local roads, including the eastward extensions of both Victoria Avenue and Uplands Drive, and a southward extension of Herbert Avenue. The road extensions and overall road network serving the Centre Point South development will offer improved connectivity to Toronto Street from the proposed development. Construction of Phase 1 of the site (which involves the southward extension of Herbert Avenue and eastward extensions of Victoria Street and Uplands Drive to Herbert Avenue) has commenced as of July 2022. For the purposes of this study, it has been assumed that the full road network and connections will be completed by the 2027 horizon.

## 3.2 TRAFFIC VOLUMES

Background traffic volumes expected for the 2027, 2032, and 2037 horizon years have been determined based on the existing traffic volumes, projected growth, and additional volumes from developments in the area (other than the subject development).

### 3.2.1 Background Growth

According to data from the 2021 census, Markdale experienced negligible growth between 2016 and 2021, with the population declining from 1,216 persons in 2016 to 1,206 persons in 2021 (a

---

<sup>3</sup> Grey County Transportation Master Plan Final Draft Report. Cole Engineering. September 2014.

decrease of approximately 0.2% per annum). Conversely, both the County of Grey and Municipality of Grey Highlands experienced steady growth during the same period (approximately 1.5% per annum and 1.25% per annum, respectively).

The *Update to the County of Grey Growth Management Strategy*<sup>4</sup> projects Grey Highlands to experience annual population growth of approximately 0.5% for the period 2021 to 2046. As a primary settlement area, it can be expected that a significant portion of that growth will occur within Markdale.

In consideration of the above, a background growth rate of 0.5% per annum has been applied to traffic volumes on Main Street for the period 2022 through the 2027, increasing to 1.5% for the period 2027 though 2037. A lower growth rate has been applied through the 2027 horizon recognizing that the study is also considering full build-out of the Stonebrook and Centre Point South developments (over 470 residential units combined) by 2027. These developments will add significant volumes to the road network in the short term, thus a lower background growth rate has been considered to mitigate an overestimation of growth. The higher growth rate beyond 2027 provides for future development.

For Toronto Street (Highway 10), a growth rate of 2% per annum was applied, recognizing that it serves as an interregional arterial that experiences additional growth pressures from outside the immediate area.

### 3.2.2 Background Developments

In addition to the noted background growth, consideration has been given to other nearby developments planned within close proximity to the study area. A site visit was conducted in February 2022, to determine development progress and estimate build-out timelines. Additional details regarding each development are provided below, with locations of each site illustrated in Figure 6. Trip estimations and distributions were taken from the traffic studies associated with each development.

#### Loon Call Residential Development

The Loon Call Residential Development is a proposed residential development located at 775309 Highway 10, north of the subject site. The development consists of 313 single-family detached units and 156 townhome units. Based on observations made during the site visit, construction has not yet commenced on the development. As per the *Loon Call Markdale Traffic Impact Study*<sup>5</sup>, a 10-year timeline has been assumed. As construction has not yet started, the 10-year

---

<sup>4</sup> *Update to the County of Grey Growth Management Study*. Hemson Consulting Ltd. July 14, 2021.

<sup>5</sup> *Loon Call Markdale Traffic Impact Study*. JD Northcote Engineering Inc. November 8, 2021.

timeline will be maintained. Therefore, it is assumed the site will be 50% built-out by the 2027 horizon and fully built out by the 2032 horizon. Traffic distribution through the study area is illustrated in Figure 7 and is representative of full build-out volumes, as per the corresponding traffic impact study.

### **Stonebrook Residential Development**

The Stonebrook Residential Development is a residential development located north of the subject site. It consists of 134 residential units (mix of semi-detached units and townhouse units) and is being constructed in 3 phases. Based on observations made during the site visit, the Phase 1 and Phase 2 sites (which are being constructed simultaneously and total 79 units) are estimated to be 30% complete (i.e. approximately 24 complete units), with substantial progress on all outstanding units. The Phase 3 site was cleared and under active construction. Construction of this development is assumed to be fully complete by the 2027 horizon. Trips have been estimated using rates contained within the *ITE Trip Generation Manual, 11<sup>th</sup> Edition* and considering the remaining units to be constructed (recognizing that the trips associated with the occupied units will be captured in the traffic counts) and are summarized in Table 4.

**Table 4: Background Development Trip Generation - Stonebrook**

LAND USE	VARIABLE	WEEKDAY AM PEAK HOUR			WEEKDAY PM PEAK HOUR		
		Total	Out	Total	In	Out	Total
single-family attached (ITE 215)	units	0.15	0.33	0.48	0.32	0.25	0.57
Phase 1 & 2	55 units	8	18	26	18	13	31
Phase 3	55 units	8	18	26	18	13	31
<b>Total</b>	<b>110 units</b>	<b>16</b>	<b>36</b>	<b>52</b>	<b>36</b>	<b>26</b>	<b>62</b>

Traffic distribution through the study area is illustrated in Figure 7: Background Development Traffic – 775309 Highway 10

Figure 8 and is representative of full build-out volumes.

### **Centre Point South Residential Development**

The Centre Point South Residential Development is a residential subdivision located at 105 Toronto Street South – immediately south of the subject site. The development consists of 239 single-family detached units and 100 townhouse units. As per the *Centre Point South Traffic Impact Study*<sup>6</sup>, an 8-year build-out was assumed. As construction commenced in 2022 (not 2018 as initially anticipated), the 8-year timeline has been maintained. Therefore, it is assumed the site will be approximately 60% built-out by the 2027 horizon and fully built-out by the 2032 horizon. Traffic distribution through the study area is illustrated in Figure 9 and is representative of full build-out volumes, as per the corresponding traffic impact study.

### **Markdale Hospital**

A new hospital is currently being constructed at 220 Toronto Street to replace the existing Markdale Hospital located at 55 Isla Street. The new hospital will have a gross floor area of 7,263 m<sup>2</sup> (78,178 ft<sup>2</sup>). As per Grey-Bruce Health Services (the hospital operator), the new hospital is expected to be complete and fully operational by the end of 2023. Trip generation and distribution for the development was obtained from the *Markdale Hospital Transportation Impact Study*<sup>7</sup>. Traffic distribution through the study area is illustrated in Figure 10 and is representative of full build-out volumes.

#### **3.2.3 Background Traffic Volumes**

The resulting 2027, 2032, and 2037 background traffic volumes are illustrated in Figure 11 through Figure 13. The background volumes are based on the adjusted 2022 volumes, increased further to reflect the noted background growth and additional volumes associated with the identified background developments. It is noted that the resulting 2037 background volumes on Toronto Street reflect annual growth in the order of 3.5 to 3.7% when compared to the 2022 volumes, whereas the background volumes on Main Street reflect growth in the order of 2.9 to 3.5%.

### **3.3 TRAFFIC OPERATIONS**

The operations of the key intersections were assessed again under background conditions at each future horizon. Results of the operational analyses are summarized in Table 5 through Table

<sup>6</sup> *Centre Point South Traffic Impact Study*. Tatham Engineering Ltd. November 2017.

<sup>7</sup> *Markdale Hospital Transportation Impact Study*. Paradigm Transportation Solutions Ltd. June 2018.

7 with detailed worksheets provided in Appendix D. Signal timings have been optimized to ensure optimal operating conditions.

As indicated, most intersections continue to provide good operations (LOS C or better) through the 2037 horizon with average delays. The exception being the intersection of Toronto Street South with Uplands Drive, which begins to experience poor operations (LOS F) on the westbound approach (Uplands Drive) in 2032 during the PM peak hour, and on both the westbound and eastbound approaches in 2037. It is noted that the volumes on the minor approaches are relatively low and thus the delays are caused by the high traffic volumes on Toronto Street. Given the proximity to the signalized intersection at Victoria Avenue (approximately 210 metres), implementing traffic signals at Uplands Drive is not recommended (the *Transportation Association of Canada Geometric Design Guide for Canadian Roads* recommends a desired spacing of 400 metres between signalized intersections to allow for signal coordination on busy corridors and consecutive turn lanes without overlap). Furthermore, the traffic volumes do not warrant the implementation of traffic signals (as per MTO traffic signal warrant criteria<sup>8</sup>). Detailed traffic signal warrant worksheets are provided in Appendix E. It is expected that some motorists on Uplands Drive will divert to the signalized intersection at Victoria Avenue to avoid the long delays experienced during the PM peak hour.

It is noted that the northbound approach at the intersection of Toronto Street with Main Street is nearing capacity ( $v/c = 0.97$ ) during the PM peak hour. While the intersection continues to provide acceptable operations, delays are anticipated with additional volumes. The capacity at the intersection is reduced by the existing single shared lane configuration on each approach. Providing exclusive left turn lanes would significantly increase the capacity of the intersection by removing left turn movements from the through volumes. The existing approach widths are sufficient to accommodate the addition of left turn lanes through line painting – albeit this would have impacts to on-street parking. Regardless, short left turn lanes can be accommodated. A comparative analysis has been conducted for the 2037 horizon year (PM peak hour only, as this is the critical period) to illustrate the impact of providing left turn lanes. The results of the analysis are provided in Table 8. As indicated, the capacity of the intersection is significantly improved and delays decrease on all approaches. Therefore, it is recommended that exclusive left turn lanes be added to each approach by the 2037 horizon.

Overall, the network performs well under background conditions, with improvements limited to the addition of left turn lanes at the intersection of Toronto Street and Main Street.

### 3.4 TURN LANE REQUIREMENTS

The existing southbound left turn lane at the intersection of Toronto Street and Uplands Drive has a storage length of 15 metres. Per recommendations contained within the *Centre Point South Traffic Impact Study*, lengthening of the turn lane to accommodate 50 metres of storage length is warranted by the 2035 horizon. In reviewing the MTO left turn lane warrants with consideration given to the background traffic volumes contained herein, a storage length of 50 metres by 2037 is confirmed.

# 4 Proposed Development

This chapter will provide additional details with respect to the proposed development, including the land uses and size, location, access, the projected site generated traffic volumes and the assignment of such to the adjacent road network.

## 4.1 SITE LOCATION

As illustrated in Figure 1, the site is located at 101 Main Street East in the community of Markdale, Municipality of Grey Highlands.

## 4.2 SITE LAND USE

The proposed development will consist of the following:

- 218 residential dwelling units of the following types:
  - 22 semi-detached units;
  - 182 townhouse units; and
  - 14 apartment units (located above commercial spaces); and
- 1,863 m<sup>2</sup> (20,053 ft<sup>2</sup>).of ground-floor commercial space.

A draft plan is illustrated in Figure 14.

## 4.3 SITE ACCESS & ON-SITE CIRCULATION

Access to the site will be provided via new municipal road connections to Main Street (opposite Lawler Drive) and Bradley Street (to the west). These internal roads will be built according to the appropriate municipal standards, allowing for two-way operations and accommodating the manoeuvring requirements of typical design vehicles (passenger vehicles, single-unit trucks, emergency vehicles, etc.).

As per the site plan, access to the commercial site will be provided by means of a right-in/right-out access to Main Street (i.e. left turns prohibited via a “pork chop” island), located approximately 100 metres east of Cambrai Road, and an internal full-moves access to Street A. The access points will be constructed to the appropriate municipal standards with the internal drive aisles satisfying requirements set forth in the Ontario Building Code regarding minimum dimensions for a fire access route (6.0 metre minimum clear width and 12.0 metre minimum centerline radius on curves).

#### 4.4 SITE PARKING

Parking requirements for the site will be detailed as part of site plan approval and will be informed by the parking requirements as set out in the *Municipality of Grey Highlands Comprehensive Zoning By-law*<sup>9</sup>. With respect to the proposed uses, the following parking rates will apply:

- townhouse or semi-detached – 2 spaces per dwelling unit;
- apartment – 1.75 spaces per dwelling unit (including 0.5 visitor spaces per unit); and
- retail establishments/service shops – 1 space per 20 m<sup>2</sup> gross floor area (GFA).

#### 4.5 SITE TRAFFIC

##### 4.5.1 Trip Generation

The number of vehicle trips expected to be generated by the proposed development for the weekday AM and weekday PM peak hours has been determined based on type of use, development size and trip generation rates per the *ITE Trip Generation Manual, 11<sup>th</sup> Edition*<sup>10</sup>. The corresponding trip generation rates are provided in Table 9 with associated trip generation provided in Table 10.

**Table 9: Trip Generation Rates**

LAND USE	VARIABLE	WEEKDAY AM PEAK HOUR			WEEKDAY PM PEAK HOUR		
		Total	Out	Total	In	Out	Total
single-family detached (ITE 210)	units	0.18	0.52	0.70	0.59	0.35	0.94
single-family attached (ITE 215)	units	0.15	0.33	0.48	0.32	0.25	0.57
multifamily housing – low-rise (ITE 220)	units	0.10	0.30	0.40	0.32	0.19	0.51
strip retail plaza (ITE 822)	1000ft <sup>2</sup> GLA	1.42	0.94	2.36	3.30	3.30	6.59

<sup>9</sup> *Municipality of Grey Highlands Comprehensive Zoning By-law 2004-50*. Jones Consulting Group Ltd. October 2005.

<sup>10</sup> *Trip Generation Manual, 11<sup>th</sup> Edition*. Institute of Transportation Engineers. September 2021.

**Table 10: Trip Estimates**

LAND USE	SIZE	WEEKDAY AM PEAK HOUR			WEEKDAY PM PEAK HOUR		
		In	Out	Total	In	Out	Total
semi-detached units	22 units	4	12	16	14	8	22
townhouse units	182 units	27	60	87	59	45	104
apartment units	14 units	2	4	6	4	3	7
commercial	20,053 ft <sup>2</sup>	28	19	47	66	66	132
<b>Total</b>		<b>61</b>	<b>95</b>	<b>156</b>	<b>143</b>	<b>122</b>	<b>265</b>

As shown, the new development is expected to generate 156 gross trips during the weekday AM peak hour and 265 gross trips during the weekday PM peak hour.

Given the mixed-use nature of the development, not all of the trips generated by the site will be new trips on the road network. The commercial element will result in internal and pass-by trips, as detailed below.

- An internal trip occurs when a motorist travels to/from the subject site via internal roads without entering the adjacent road network. For instance, a resident of the development visiting the commercial area via the internal road network does not contribute a new trip to the external road network. A 10% reduction applied to account for internal trips.
- A pass-by trip occurs when a motorist is already on the road network for another purpose and chooses to stop at a different site before continuing to their primary destination. For example, a motorist on Main Street East may stop at the commercial block before continuing to their original destination. Per the ITE *Trip Generation Handbook*<sup>11</sup>, pass-by rates for the *shopping center* land-use (considered the most similar use to the commercial space on-site) are estimated to be 34% of total trips during the weekday PM peak hour. Pass-by rates during the weekday AM peak hour are not measured, recognizing that retail stores are often closed during the AM peak hour.

A summary of the resulting trip estimates by type is provided in Table 11. As indicated, the development is expected to generate 112 new trips during the weekday AM peak hour and 161 new trips during the weekday PM peak hour.

---

<sup>11</sup> *Trip Generation Handbook, 3<sup>rd</sup> Edition*. Institute of Transportation Engineers. September 2017.

**Table 11: Trip Estimates by Type**

TRIP TYPE	WEEKDAY AM PEAK HOUR			WEEKDAY PM PEAK HOUR		
	In	Out	Total	In	Out	Total
Total Trips	61	95	156	143	122	265
Internal Trips (10%)	6	10	16	14	12	26
Pass-by Trips (34%)	0	0	0	22	22	44
<b>New Trips</b>	<b>55</b>	<b>85</b>	<b>140</b>	<b>107</b>	<b>88</b>	<b>195</b>

#### 4.5.2 Trip Distribution & Assignment

The distribution of site-generated trips was considered from two perspectives: pass-by trips and new trips.

As previously indicated, pass-by trips are those trips already on the road network which are expected to stop at the subject site's commercial area as they travel past. The distribution of these trips is proportional to directional volumes on Main Street East during the weekday PM peak hour period. The largest approach volume past the site will generate the largest number of pass-by trips. The following distribution was realized:

- from the east – 45%; and
- from the west – 55%

The distribution of new trips generated by the entire development has been established based on observed traffic patterns on the adjacent road network in the 2022 counts and the proximity of the site to surrounding built-up areas and employment centres. The following distribution has been applied:

- to/from the north via Toronto Street – 35%;
- to/from the south via Toronto Street – 40%;
  - via Victoria Street – 15%;
  - via Uplands Drive – 25%;
- to/from the east via Main Street – 10%; and
- to/from the west via Main Street – 15%.

Trip assignment to the road network via the various access points has been established based on the above distribution with consideration given to the site layout and anticipated travel routes.

To ensure a conservative approach, no trips have been assigned to the RIRO commercial access (i.e. all trips that would use the RIRO have been assigned to the new municipal road connection on Main Street East). The RIRO is not expected to experience any operational concerns under future horizons – it will experience in the order of 25-60 inbound trips during peak periods which, as free moving right turns, will cause minimal delay to through traffic. Similarly, the 2-7 outbound trips expected during peak periods (translating to 1 outbound trip every 9 to 30 minutes) will not experience significant delays.

The resulting site-generated traffic volumes are illustrated in Figure 15 (new trips), Figure 16 (pass-by trips), and Figure 17 (total trips).

# 5 Future Total Conditions

This chapter will address the resulting impacts of the proposed development on the adjacent road system. Three areas will be addressed:

- operations of the key intersections;
- review of the available sight lines at the existing access points; and
- potential improvements to the study area road network, if necessary.

## 5.1 TRAFFIC VOLUMES

To assess the impacts of the increased traffic resulting from the proposed development, the traffic volumes generated by the site were combined with the 2027, 2032, and 2037 background volumes.

### 5.1.1 Center Point South Trip Re-Assignment

Build-out of the subject development will provide a new north/south link to Main Street East (opposite Lawler Drive) for trips destined to/from the Centre Point South development. To consider the impacts of this new link, a portion of the Centre Point South development traffic has been re-assigned to the new connection. The redistribution of the Centre Point South trips is illustrated in Figure 18.

### 5.1.2 Total Volumes

The resulting future total volumes are illustrated in Figure 19 through Figure 21.

## 5.2 TRAFFIC OPERATIONS

The operations of the key intersections were assessed again under total conditions at each future horizon. Results of the operations analyses are summarized in Table 12 through Table 14 with detailed worksheets provided in Appendix F. Signal timings have been optimized to ensure optimal operating conditions.

L: left T: thru R: right LT: left-thru LT: left-thru-right TR: thru-right LR: left-right

As indicated, most intersections continue to provide acceptable operations (LOS D or better) through the 2037 horizon with average delays. Similar to the background conditions, the operations of the intersection of Toronto Street South with Uplands Drive will experience poor operations (LOS F). However, as previously noted, given the proximity of this intersection to the signalized intersection with Victoria Street, traffic signals are not recommended. Furthermore, signals are not warranted under total conditions (detailed worksheets are provided in Appendix E). It is noted that the signalized intersection at Victoria Avenue will readily accommodate additional volumes which may divert away from Uplands Drive during the PM peak if delays are lengthy.

The intersection of Toronto Street with Main Street will continue to provide adequate operations through the 2037 horizon in its current configuration; however, similar to operations under background conditions, the northbound and southbound approaches are nearing capacity ( $v/c = 1.00$ ) during peak conditions. As noted in Section 3.3, intersection operations improve significantly over the existing configuration with the addition of left turn lanes on each approach. The comparative assessment was re-visited under 2037 total conditions to illustrate the benefit of introducing left turn lanes at the intersection, the results of which are provided in Table 15. As noted, approach delays decrease by up to 29 seconds and utilised capacity decreases by up to 0.42 compared to the existing configuration under 2037 total conditions.

**Table 15: Intersection Operations – 2037 Total (PM Peak – with left turn lanes)**

INTERSECTION, APPROACH & CONTROL	WITHOUT LEFT TURN LANES				WITH LEFT TURN LANES		
		Delay	LOS	$v/c$	Delay	LOS	$v/c$
Main Street & Toronto Street	EB	signal	42	D	0.83	25	C
	WB	signal	29	C	0.61	24	C
	NB	signal	40	D	0.96	11	C
	SB	signal	30	C	0.91	11	C
	overall	signal	34	C	0.92	15	B
							0.54

Overall, the road network performs well through the 2037 horizon under future total conditions. As identified under background conditions, it is recommended that exclusive left turn lanes be added to the intersection of Toronto Street with Main Street by the 2037 horizon to mitigate operational concerns.

## 5.3 TURN LANE REQUIREMENTS

The need for exclusive left and right turn lanes (where such do not already exist) were reviewed based on future total volume projections.

### 5.3.1 Left Turn Lanes

For two-lane undivided highways, MTO warrants for left turn lanes at unsignalized intersections are based on design speed, advancing volume (i.e. traffic travelling in the same direction as the left-turning traffic), opposing volume (i.e. traffic travelling in the opposite direction as the left-turning traffic), and the percentage of left turning traffic in the advancing volume. The design speed for all investigated intersections is 60 km/h.

At Herbert Avenue, warrants for 10% left turns in the advancing volume were run and indicate that a westbound left turn lane is not warranted under any horizon.

At Lawler Drive, the eastbound left turning volumes are extremely low (3-4 vehicles during peak times) thus do not warrant an eastbound left turn under any horizon. Warrants for 15% left turns in the advancing volume were run and indicate that a westbound left turn lane is also not warranted under any horizon.

As noted in Section 3.4, a 50-metre southbound left turn lane is warranted at Uplands Drive under background conditions. Despite the reduction in southbound left turning volumes due to the Centre Point South trip reassignment (see Section 5.1.1), a 50-metre left turn lane is still warranted under future total conditions. A northbound left turn lane to serve the hospital access (opposite Uplands Drive) is not warranted under any horizon due to low turning volumes. It is noted that the existing southbound left turn lane does extends well south of Uplands Drive, servicing the commercial developments located south of Uplands Drive. The southbound left turn lane, south of Uplands Drive could conceivably be converted into a continuous two-way left turn lane to serve the hospital access and improve turning performance in both the northbound and southbound directions.

### 5.3.2 Right Turn Lanes

MTO guidelines suggest that an exclusive right turn lane be considered where right turning volumes exceed 60 vehicles per hour (vph) and/or impede the operations of through traffic. Throughout the network, a limited number of movements exceed this threshold by the 2037 horizon during one or both peak periods:

- northbound right turn at Toronto Street and Uplands Drive - (30 AM, 89 PM)
- eastbound right turn at Main Street and Street C eastbound (24 AM, 79 PM)

Despite exceeding the required threshold, right turn lanes are not considered necessary given the otherwise satisfactory operations of each of the noted movements. It is noted that the eastbound right turn movement from Main Street at Street C will be less than indicated recognizing that a portion of the right turn volumes will enter the commercial block via the RIRO access.

#### 5.4 SIGHT LINE ASSESSMENT

A sight line assessment along Main Street East was conducted at the locations of the future commercial access and the intersection of Main Street East & Street C/Lawler Drive to verify that the available sight lines are appropriate. The sight line assessment has considered both minimum stopping sight distance and intersection sight distance, as per Transportation Association of Canada (TAC) standards and details below.

- The minimum stopping sight distance provides a sufficient distance for an approaching motorist to observe a stationary hazard in the road and bring their vehicle to a complete stop prior to the hazard.
- The intersection sight distance allows a vehicle to enter a main road from a side street (or site access) and attain the appropriate operating speed without significantly impacting the operating speed of an approaching vehicle.

The minimum stopping and intersection sight distance requirements are provided in Table 16 for a design speed of 60km/h (reflective of the 50km/h posted speed limit on Main Street East). The sight lines measured at the site are also summarized in Table 16 and illustrated in Figure 22.

**Table 16: Sight Lines**

LOCATION	DESIGN SPEED	STOPPING SIGHT DISTANCE	INTERSECTION SIGHT DISTANCE		AVAILABLE SIGHT LINES TO/FROM	
			Left Turn	Right Turn	East	West
Main St E & Lawler Dr	60km/h	85m	130 m	110 m	>200 m	>200 m
Commercial Access	60km/h	85m	130 m	110 m	>200 m	100 m

As shown, the available sight lines along Main Street East at Street C are excellent, with sight lines exceeding 200 metres in both directions. No improvements to the sight lines are required at this intersection.

The sight lines to/from the east at the commercial access are greater than 200 metres, although it is noted that such are not critical due to the proposed RIRO configuration of the access. The

sight lines to/from the west are approximately 100 metres, limited by the vertical curve just east of Cambrai Road. While the sight lines do not satisfy the intersection sight distance requirements, they do satisfy the more critical minimum stopping sight distance for the noted design speed. Furthermore, a sight line of 100 metres satisfies the intersection sight distance for a design speed of approximately 54 km/h, or 4 km/h above the posted speed limit,

In consideration of the above, the available sight lines are considered acceptable.

# 6 Summary

## **Proposed Development**

The study has addressed the transportation impacts associated with the proposed mixed-use development to be located at 101 Main Street East in the community of Markdale, Municipality of Grey Highlands. The proposed development consists of 218 residential dwelling units (22 semi-detached units, 182 townhome units and 14 apartment units) and 1,863 m<sup>2</sup> of ground floor commercial space.

Upon completion, the site is expected to generate a total of 125 trips during the weekday AM peak hour and 208 trips during the weekday PM peak hour. When considering internal and pass-by trips, the site is expected to generate 112 new trips during the AM peak hour and 161 new trips PM peak hour.

## **Transportation Impacts**

To assess the impact of the proposed development, the operations of the key intersections within the study area were analyzed under existing (2022) conditions and future (2027, 2032, and 2037) horizon periods.

The results of the operational analyses indicate that all but one of the key intersections will provide acceptable operations (LOS D or better) through the 2037 horizon under total conditions. The intersection of Toronto Street South with Uplands Drive will experience poor operations (LOS F during the PM peak hour) during the 2032 horizon under background conditions, with similar operations experienced under total conditions. Traffic signals are not warranted, nor are they recommended give the available spacing from the adjacent signalized intersection of Toronto Street South with Victoria Avenue. It is expected that outbound traffic at Uplands Drive will divert to the signalized intersection at Victoria Avenue should delays become onerous during the PM peak hour.

Overall, the proposed development is not expected to have a significant impact on the study area road network in terms of intersection operations.

## **Turn Lane Requirements**

The need for exclusive left and right turn lanes was reviewed at all intersections where such did not already exist.

Left turn lanes were determined to be unwarranted at the intersections of Main Street East with Herbert Avenue and Lawler Drive/Street C.

The existing southbound left turn lane on Toronto Street South at Uplands Drive requires an overall storage length of 50 metres (from its current 15 metre length) by the 2037 horizon, as dictated by background conditions and further confirmed under total conditions. A northbound turn lane at this intersection is not warranted but may be beneficial to serve the new hospital access (such could be accommodated through conversion of the existing southbound left turn lane, south of Uplands Drive into a continuous left turn lane to serve both the hospital access and the existing commercial development along Toronto Street South).

Right turn lanes were not considered necessary at any of the key intersections.

#### **Sight Line Assessment**

Sight lines at the proposed commercial access on Main Street East and future southern leg of the intersection of Main Street East with Street c were reviewed in the context of TAC requirements for stopping sight and intersection sight distances. Based on the results of the review, sight lines were found to be appropriate.

## **Appendix B: LOS Definitions**

# Level of Service - Unsignalized Intersections

Level of Service (LOS) for unsignalized intersections is defined in terms of control delay for each critical lane. Control delay include initial deceleration, queue move-up time, stopped delay, and final acceleration delay, and is a function of the service rate or capacity of the approach and degree of saturation.

The following table describes in detail the characteristics of each level:

LOS	Description of Traffic Operations	Delay (sec/veh)
A	Little or no delays	$0 < d \leq 10$
B	Short traffic delays	$10 < d \leq 15$
C	Average traffic delays	$15 < d \leq 25$
D	Long traffic delays	$25 < d \leq 35$
E	Very long traffic delays	$35 < d \leq 50$
F	Extreme delays with queuing which may cause congestion affecting other traffic movements in the intersection	$d > 50$

source: 2010 Highway Capacity Manual

# Level of Service - Signalized Intersections

Level of Service (LOS) for signalized intersections is defined in terms of delay, which is made up of a number of factors that relate to control, geometrics, traffic, and incidents. Only the portion of total delay attributed to the control facility is quantified. This control delay includes initial deceleration, queue move-up time, stopped delay, and final acceleration delay.

The following table describes in detail the characteristics of each level:

LOS	Description of Traffic Operations	Delay (sec/veh)
A	Describes operations with very low control delay, up to 10 seconds/vehicle. This level of service occurs when progression is extremely favourable and most vehicles arrive during the green phase. Most vehicles do not stop at all at this LOS. Short cycle lengths may also contribute to low delay.	$d \leq 10$
B	Describes operations with control delay greater than 10 seconds and up to 20 seconds/vehicle. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop at this level than at LOS A, causing longer average delays.	$10 < d \leq 20$
C	Describes operations with control delay greater than 20 seconds and up to 35 seconds/vehicle. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though many still pass through the intersection without stopping.	$20 < d \leq 35$
D	Describes operations with control delay greater than 35 seconds and up to 55 seconds/vehicle. At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavourable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures become noticeable.	$35 < d \leq 55$
E	Describes operations with control delay greater than 55 seconds and up to 80 seconds/vehicle. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.	$55 < d \leq 80$
F	LOS F describes operations with control delay in excess of 80 seconds/vehicle. This oversaturation, considered to be unacceptable to most drivers, occurs when arrival flow rates exceed the design capacity of the intersection. It may also occur at high v/c ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such high delay levels.	$d > 80$
