CERTIFICATE OF APPROVAL
MUNICIPAL AND PRIVATE SEWAGE WORKS
NUMBER 2080-74ZPJQ
Issue Date: March 26, 2008

Georgian Villas Inc.
Post Office Box, No. 911
Owen Sound, Ontario
N4K 6H6

Site Location: Cobble Beach- Stage 1
Lot 28-32, Concession 3
Georgian Bluffs Township,
County of Grey.

You have applied in accordance with Section 53 of the Ontario Water Resources Act for approval of:

establishment of Stormwater Management Works to service approximately 86ha. residential/golf course/commercial development and 11.4ha. external roadways (Grey County Road) except for the areas denoted as 210 (3.7ha.) and 211 (2.29ha.) located on the west shores of Owen Sound Bay (Georgian Bay), for normal level of quality control comprising of the following:

Pond 2 (to service 14.5ha.):

- a wet pond with two (2) open channel inlets consisting of approximate permanent pool volume of 6,100cu.m., extended detention volume of 1,512cu.m. and total storage volume of 7,612cu.m., together with:
- one (1) 150mm diameter outlet pipe to discharge onto a rip-rapped channel leading into the Owen's Sound Bay,
- one (1) 10m wide 900mm deep stepped trapezoidal overflow spillway to discharge pond water to the Owen's Sound Bay via a rip-rap channel,

Pond 3 (to service 62.7ha.):

- a wet pond with one (1) triple-500mm and one (1) 600mm diameter CSP inlets, one (1) 120m long approximately 5m wide natural forebay with two (2) open channel inlets, and consists of approximate permanent pool volume of 16,170cu.m., extended detention volume of 2,803cu.m. and total storage volume of 18,973cu.m. together with:
- one (1) 250mm diameter outlet pipe to discharge onto a rip-rap apron (discharge point DP#2) to the Owen's Sound of Georgian Bay via a 8m wide 1m deep, approximately 420m long grassed trapezoidal ditch and two (2) 1200mm diameter culverts under McLeese Drive,

- one (1) 13.6m wide 450mm deep trapezoidal overflow spillway to discharge pond water to the Owen's Sound Bay via the trapezoidal ditch and the twin culvert under McLeese Drive;

Grassed swale/ditch (to service 3.07ha. # 212 area): - one (1) 3.25m wide 500mm deep, approximately 150m long trapezoidal grassed swale/ditch complete with straw bale or rock check dams to discharge storm water onto a rip-rap apron (discharge point DP#3) of the Owen's Sound Bay at the east end of the Church Side Road East;

including appurtenances, spill control and erosion/sedimentation control measures to minimize the effects on external lands and to the receiver Bay;

all in accordance with the **Application for Approval of Municipal and Private Sewage Works, Stormwater Management Facility**, dated April 16 and received May 2, 2007, Stormwater Management Report July 2007, Plans drawing Map 6 (Rev 2) and addendum documents prepared and submitted by Stephen Cobean, P.Eng., Pryde Schropp McComb Inc., Consulting Engineers.

For the purpose of this Certificate of Approval and the terms and conditions specified below, the following definitions apply:

"Certificate" means this entire Certificate of Approval document, issued in accordance with Section 53 of the Ontario Water Resources Act, and includes any schedules;

"Director" means any Ministry employee appointed by the Minister pursuant to Section 5 of the Ontario Water Resources Act;

"Ministry" means the Ontario Ministry of the Environment;

"District Manager" means the District Manager of the Barrie District Office of the Ministry;

"Owner" means Georgian Villas Inc. and included its heirs and assignees.

"Municipality" means The Township of Georgian Bluffs; and,

"Works" means the sewage works described in the Owner's application, this Certificate and in the supporting documentation referred to herein, to the extent approved by this Certificate.

You are hereby notified that this approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

1. GENERAL PROVISIONS

(1) Except as otherwise provided by these Conditions, the Owner shall design, build, install, operate and

maintain the Works in accordance with the description given in this Certificate, the application for approval of the works and the submitted supporting documents and plans and specifications as listed in this Certificate.

(2) Where there is a conflict between a provision of any submitted document referred to in this Certificate and the Conditions of this Certificate, the Conditions in this Certificate shall take precedence, and where there is a conflict between the listed submitted documents, the document bearing the most recent date shall prevail.

(3) Where there is a conflict between the listed submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(4) This certificate is for Phase 1 works only as shown on drawing No. MAP6 revision 2 and the Owner shall request amendment of the certificate for Phase 2 works, when future construction approval for the areas denoted as 210 (3.7ha.) and 211 (2.29ha.) is required.

2. EXPIRY OF APPROVAL

The approval issued by this Certificate will cease to apply to those parts of the Works which have not been constructed within five (5) years of the date of this Certificate.

3. CHANGE OF OWNER

The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within thirty (30) days of the change occurring:

- (a) change of Owner;
- (b) change of address of the Owner;
- (c) change of partners where the Owner is or at any time becomes a partnership, and a copy of the most recent declaration filed under the Business Names Act, R.S.O. 1990, c.B17 shall be included in the notification to the District Manager; and
- (d) change of name of the corporation where the Owner is or at any time becomes a corporation, and a copy of the most current information filed under the Corporations Information Act, R.S.O. 1990, c. C39 shall be included in the notification to the District Manager.

4. OPERATION AND MAINTENANCE.

(1) The Owner shall ensure that the design minimum liquid retention volumes are maintained in the wetponds at all times.

(2) The Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and/or vegetation.

(3) The Owner shall maintain a logbook to record the results of these inspections and any cleaning and maintenance operations undertaken, and shall keep the logbook updated and ready at the site for inspection by the Ministry. The logbook shall include the following:

- (a) the name of the Works; and
- (b) the date and results of each inspection, maintenance and cleaning, including an estimate of the quantity of any materials removed.

5. RECORD KEEPING

The Owner shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the operation and maintenance activities required by this Certificate.

6. MONITORING OF THE POND EFFLUENT

The Owner shall carry out the following monitoring program for the performance evaluation of the facility to meet the design projected level of seventy percent (70%) removal of Total Suspended Solids (TSS) in the stormwater ponds prior discharge out to the Georgian Bay.

(1) At least thirty (30) days prior to the anticipated commencement date of the monitoring program, the Owner shall submit to the District Manager for review and approval a detailed work plan for the monitoring program outlining the parameters to be monitored, the sampling locations, sampling protocols, techniques and frequencies, as well as the detection limits of laboratory procedures.

(2) The monitoring program shall commence upon connection of the outlet control structure of the facilities to the receiving water course and shall continue for two years thereafter.

(3) Samples shall be collected at the following sampling points, at the frequency specified, by means of the specified sample type and analyzed for each parameter listed and all results recorded:

Table 1 - Water Quality Monitoring
Sampling Location: 1. pond inlet structures and 2. at the proposed outlet headwalls (DP#1 and DP#2); Indian Creek (as control), Creek 1 and at Creek 2 as shown on MAP 6, dated 18.10.2007.
Type- Grab
Frequency- for the detailed characterization of the water quality treatment performance of the facility during a minimum of three (3) rainfall/run-off events per year (spring, summer and fall) at least one of the events being a spring freshet event. A minimum of three (3) grab samples at each location per year is necessary.
Parameters:
- CBOD5
- Total Suspended Solids
- Total Phosphorus
- Dissolved Nutrients (including Phosphates, Nitrates, Nitrites and Ammonia)
- Metals (including antimony, mercury, arsenic, cadmium, copper, lead, zinc, nickel, iron, vanadium, chromium, tin, and cobalt).
- Chloride

(4) The methods and protocols for sampling, analysis and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

- (a) the Ministry's Procedure F-10-1, "Procedures for Sampling and Analysis Requirements for Municipal and Private Sewage Treatment Works (Liquid Waste Streams Only), as amended from time to time by more recently published editions;
- (b) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater" (January 1999), ISBN 0-7778-1880-9, as amended from time to time by more recently published editions;
- (c) the publication "Standard Methods for the Examination of Water and Wastewater" (20th edition), as amended from time to time by more recently published editions;

(5) The Owner shall prepare, and submit to the District Manager a performance report, on an annual basis, by April 30th of each year. The first such report shall cover the annual period following the commencement of operation of the Works and subsequent reports shall be submitted to cover successive annual monitoring periods following thereafter. The reports shall contain, but not be limited to, the following information:

- (a) a summary and interpretation of all monitoring data and the performance of the facility based on Total Suspended Solids removal and its effect (if any) on the receiving water body, including comparison of the water quality data with applicable criteria such as the Provincial Water Quality Objectives (PWQOs);
- (b) an evaluation of the pond's performance and its ability to meet the design performance criteria of 70% Total Suspended Solids removal on a long-term average basis.
- (c) a description of any operating problems encountered and corrective actions taken during the reporting period and the need for further investigations in the following reporting period for pond refinements or ways of improving the performance of the facility to meet the performance target;
- (d) any need for modifications of the monitoring program and/or the work plan; and a summary of any complaints received during the reporting period and any steps taken to address the complaints;
- (f) any other information that is deemed to have been obtained by the Owner pursuant to the requirements of this certificate that the District Manager requires for inclusion in the reports from time to time.

(6) In the annual report prepared at the end of three (3), the Owner shall include recommendations for either continuation of the monitoring program, or the cessation of it, as appropriate from a conclusion based on all previous evaluations of the performance of the facility. A recommendation for the termination of the monitoring program must be accompanied by analytical interpretation of previous monitoring results and performance trends demonstrated to the satisfaction of the Ministry that the facility achieves its design target of 70% removal of Total Suspended Solids and metals on a reasonably continuous basis.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the Works are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Certificate and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review.
2. Condition 2 is included to ensure that, when the Works are constructed, the Works will meet the standards that apply at the time of construction to ensure the ongoing protection of the environment..
3. Condition 3 is included to ensure that the Ministry records are kept accurate and current with respect to approved works and to ensure that subsequent owners of the works are made aware of the certificate and continue to operate the works in compliance with it.
4. Condition 4 is included to require that the Works be properly operated and maintained such that the environment is protected .
5. Condition 5 is included to require that all records are retained for a sufficient time period to adequately evaluate the long-term operation and maintenance of the Works.
6. Condition 6 is included to ensure that the effluent quality is monitored and the performance of the works is evaluated, recorded and reported on an annual basis to ensure that the Works are operated in a manner that minimizes any off property impacts from the construction works and stormwater discharged from the site is to the receiver sewer during periods and at rates that minimizes the environmental impact on the receiver.

In accordance with Section 100 of the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, as amended, you may by written notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 101 of the Ontario Water Resources Act, R.S.O. 1990, Chapter 0.40, provides that the Notice requiring the hearing shall state:

1. The portions of the approval or each term or condition in the approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The Certificate of Approval number;
6. The date of the Certificate of Approval;
7. The name of the Director;
8. The municipality within which the works are located;

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal

The Director

1.0 Introduction

1.1 BACKGROUND AND OBJECTIVE

The proposed Cobble Beach development (formerly Georgian Villas) is a new residential/golf course development located on the west shores of Owen Sound Bay (Georgian Bay). Refer to Figure 1 for the Regional Location Map of the site.

Phases 1 and 2 of the development will comprise of up to 352 single family residential units, 63 townhouse units and up to 191 multi-family units on approximately 86 ha of the site. A third phase, which will not be developed for a number of years, will consist of 184 single family units and 215 multi-family units. Table 1 provides details of the residential density being proposed for the various phases of the Cobble Beach Development.

As part of the review for Draft Plan Approval for Phase 2 (File No. 42T-2006-02), a report entitled **Stormwater Management Report – Cobble Beach Development – Phase 1 and 2**, August, 2006, as prepared by Pryde Schropp McComb, Inc.

Enclosed in Appendix A, are the Draft Plans for both Phase 1 and Phase 2 that have been approved by the County of Grey.

Plans are now underway for registration of portions of the two (2) Draft Plans to be referred to as **Stage 1 (2007)**. Figure 2 provides details of the first stage of registration planned for 2007. The objective of this report is to prepare a Stormwater Management (SWM) Plan for Stage 1 (2007) of the Cobble Beach Development that will address how runoff from the site will be handled on site, in order to meet the requirements of the Ministry of Environment, Grey Sauble Conservation Authority and Township of Georgian Bluffs. The design of the stormwater management facilities for Stage 1 (2007) will take into consideration all of Phases 1 and 2 to ensure that these facilities can accommodate the ultimate development of both phases.

The report will be used to assist in the satisfying of Conditions of Draft Approval as summarized below.

1.1.1 Phase 1 (File No. 42T-2004-02)

- 2. That Phase 1 consist of that portion of the golf course within this plan (Blocks 15, 16 & 17a & b) and the equivalent of 400 residential units. The type and location of these units will be determined through the zoning by-law amendment process. The zoning by-law process, including the use of the holding (-h) provision will include confirmation of approval from the Ministry of the Environment for the site servicing of Phase 1 which will include sewage collection, treatment and disposal, potable water distribution, storm water management and surface water drainage.*

	Stage 1 ¹	Balance of Draft Approved lands (Draft 1 & Draft 2) ^{2,4}	Future Development ³	
Single-Family	72	280	169	521 units
Townhouse	28	35	0	63 units
Multiple Family	92	99	216	407 units
Village Centre Residential	0	200	0	200 units
Total Residential Units	192	614	385	1,191 units

COMMERCIAL SQUARE FOOTAGE

	Yrs: 2007-2012	Yrs: 2013-2018	Yrs: 2019-2025	TOTALS
Clubhouse/Inn ⁶	27,484			27,484 sq.ft.
Starters Hut	1,000			1,000 sq.ft.
View House	3,300			3,300 sq.ft.
Village Centre Commercial ^{7,8}		26,911	26,910	53,821 sq.ft.
TOTAL	31,784	26,911	26,910	85,605 sq.ft.

Notes:

1. Unit Counts for Stage 1 based on a plan prepared by Design Plan Service dated February 8, 2007
2. Unit Counts for Balance of Draft Approved Lands based on difference between Draft 1 (DPS Sept 14, 2007) and Draft 2 (DPS Feb 6, 2007) and Stage 1 dwg (DPS Feb 8, 2007)
3. Unit Counts for Future Development based on Overall Development Concept dated December 14, 2006, as prepared by Design Plan Services.
4. Unit Counts for Phases 1 and 2 represent the maximum units possible.
5. Development Stage based on approximately 60 units per year absorption rate
6. Clubhouse also includes a 2nd floor Inn (10 rooms) and basement cart storage.
7. Nature of Village Centre commercial/retail space to be determined. It would likely contain a hotel/inn, small shops and restaurants along with some community areas like a Pavilion.
8. Village Centre commercial includes a 36 room hotel.

COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)
TOWNSHIP OF GEORGIAN BLUFFS

All other lands intended for residential, commercial or mixed use purposes, included in this approval will be subject to the holding provision until sufficient supply of municipal services (sewer and water) are confirmed by the appropriate authority.

- 17. That a Master Servicing Plan be prepared by a technically qualified consultant for the approval of the Township of Georgian Bluffs in consultation with the Ministry of the Environment and Grey Sauble Conservation Authority. The Master Servicing Plan shall include provisions for sanitary sewage, potable water services, road construction, utility services and surface/storm water management. The report will also detail the methods that will be used to control surface water flow and erosion and sedimentation within the development lands and abutting properties during and following construction. The Master Servicing Plan shall include suitable provisions for phasing of certain works and be incorporated into the Subdivision Agreement.*
- 18. That Block 27 shall be deeded to the Township of Georgian Bluffs for storm water management purposes. The Subdivision Agreement shall contain appropriate provisions for the granting of an easement for Block 27 for the owner of the golf course to use and maintain the block as a golf course feature as well as provisions for the maintenance of the block for its storm water management purposes.*

1.1.2 Phase 2 (File No. 42T-2006-02)

- 18. That a Master Servicing Plan be prepared by a technically qualified consultant for the approval of the Township of Georgian Bluffs in consultation with the Ministry of the Environment and Grey Sauble Conservation Authority. The Master Servicing Plan shall include provisions for sanitary sewage, potable water services, road construction, utility services and surface/storm water management. The report will also detail the methods that will be used to control surface water flow and erosion and sedimentation within the development lands and abutting properties during and following construction. The Master Servicing Plan shall include suitable provisions for phasing of certain works and be incorporated into the Subdivision Agreement.*

This report will be submitted to the County of Grey's Planning Department, Township of Georgian Bluffs and Grey-Sauble Conservation Authority in support of the preparation of Clearance Letters to permit final approval of Stage 1 (2007) of the Cobble Beach project.

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

1.2 SITE DESCRIPTION

The Cobble Beach property is located on the western shore of Owen Sound Bay (Georgian Bay) along Grey County Road No. 1, approximately 10 kms north of the City of Owen Sound.

The property is legally described as Part Lots 28, 29 and 34 and all of Lots 30 through 33, Concession 3, former Township of Sarawak, County of Grey.

The property is bounded on the south by Church Sideroad East, on the west by Grey County Rd. No. 1, on the north by Presqu'île Road, and on the east side by Owen Sound Bay. Phases 1 and 2 encompass approximately 86 hectares of the 235 hectare site. Phase 3 will be developed at a later time and will be handled by a separately approved stormwater management plan.

The existing land use of the property consists mainly of vacant grass fields and wooded areas. There is a single family residence located in the middle of the site on the southerly portion of the property.

As outlined above, Stage 1 (2007) is a combination of both Phases 1 and 2 as detailed in Figure 2. A golf course has been recently constructed on the site which will form part of the overall development.

1.3 BACKGROUND REPORTS

The following background reports have been previously prepared which are relevant to the subject lands:

1.4 STORMWATER MANAGEMENT – PHASE 1 AND 2 (PRELIMINARY)

The **Stormwater Management Report for Cobble Beach for Phase 1 and 2**, as prepared by Pryde Schropp McComb, Inc., August, 2006, concluded the following:

1. *Stormwater quantity control of post-development runoff is not required at the subdivision. The minor and major flow systems will direct all runoff into Owen Sound Bay. Flows will be conveyed through two ponds prior to discharging into the bay.*
2. *The discharge point for Phase 1 and 2 into Owen Sound Bay has been classified as a Type 2 habitat. A 'Normal' protection level for all runoff leaving the site will therefore be provided to meet the Ministry of the Environment's guidelines for protecting Type 2 habitat.*
3. *Stormwater quality control for the development will be provided by the two existing ponds which will function as extended detention wet ponds.*
4. *An extended detention control device at the outlet of Ponds 2 and 3 will provide 24 hour drawdown of the volume of runoff to be generated under a 25 mm storm event.*
5. *Storm runoff will be conveyed through the development by means of a minor system designed to convey the 5 year storm event.*

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

6. *A two stage weir will be constructed at the outlet of each pond that will convey flows in excess of the 25 mm event. The first stage of the weir will convey storm events up to the 5 year event while the second stage will convey storms exceeding the 5 year event.*
7. *Flow from Pond 3 will be directed to Pond 2 via an open channel. A culvert will be placed under McLeese Drive that will allow runoff to flow across McLeese Drive. This culvert shall be designed to handle a minimum 25 year storm event.*
8. *The major system outlet for the subdivision will be through Ponds 2 and 3. Pond 2 will receive runoff from the entire Phase 1 and 2 development and will discharge this flow over the east side of the pond into Owen Sound Bay. The major system will also incorporate the existing drainage ditches located throughout the development in order to reduce the overland flow to be conveyed by the subdivision streets. These ditches will also provide outfall locations for the proposed storm sewer system which will allow a smaller pipe diameter to be used throughout the development.*
9. *Future phases of the development will consist of Phase 3 and a Village Centre. Stormwater Management Plans will be required to be prepared once these developments are submitted for Draft Plan approval. Pond 5 has been constructed as part of the golf course development and will be incorporated into the stormwater management plan for Phase 3 to address the quality control requirements for this phase of the development. It is proposed to incorporate Oil Grit Separators to meet the quality control requirements for the Village Centre portion of the development. Quantity control for both future phases is assumed not to be required as runoff will discharge directly into Owen Sound Bay.*

Since the submission of this report to the approval agencies as part of the Draft Plan review for Phase 2, there were no requested changes to the conclusions and as such the conclusions of the **Preliminary Stormwater Management Report for Phase 1 and 2** will serve as the basis for the Final Stormwater Management Plan to be prepared for Stage 1 (2007).

1.5 STORMWATER MANAGEMENT CRITERIA

Based on current Stormwater Management (SWM) practises, the following site-specific SWM criteria have been identified:

- Ensure that all runoff discharging off-site from Stage 1 (2007) meets the required water quality protection level at each designated discharge point;
- Ensure that in the design of stormwater management facilities to accommodate Stage 1 (2007) that future registration of development associated with Cobble Beach are taken into consideration in the planning/design;
- Ensure there is no adverse flooding impact on properties located within the subdivision development;

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

- Ensure there is no adverse flooding impact on the shoreline residential properties that presently exist located downstream of the Cobble Beach Development;
- Ensure the development does not cause any significant water quality deterioration in any surface waters or ground water that receive stormwater flow from the development areas

2.0 Stormwater Management Plan

2.1 METHODOLOGY

As discussed in Section 1.5, the objective of the Stormwater Management (SWM) Plan for Stage 1 (2007) of the Cobble Beach Development, is to review the need for stormwater quality control as well as ensure that there is no flooding impact on properties located within and downstream of the subject property. These objectives will be achieved by completing the following tasks:

- i. Determine existing drainage conditions;
- ii. Determine post development drainage conditions;
- iii. Determine the quality control discharge requirements at each discharge point;
- iv. Design SWM measures that meet the SWM criteria for the development;
- v. Summarize the analysis by identifying conclusions and recommendations.

2.2 PRE-DEVELOPMENT DRAINAGE CONDITIONS

The proposed development prior to the construction of the golf course, consisted mainly of grassed fields with a number of wooded areas located throughout the site. Other than a single family dwelling constructed on the south side of the development, the property was vacant.

In 2004/2005, a golf course was constructed on the site. In 2005, a Maintenance Building located in the central portion of the site was constructed as well. A stormwater management plan for the golf course development was submitted to the Township, County and Conservation Authority in September 2002, to address the proposed management of runoff from the course. Stormwater Management for the Maintenance Building is part of a block of land that will drain directly into Owen Sound Bay. Stormwater quality provisions for this building include providing 600 mm sumps in the parking lot catchbasins and running eavestrough drains onto the grassed areas where possible. Drainage from the Maintenance Building eventually discharges into a natural ditch. This ditch will connect into the drainage outlet from Pond 5, on the east side of McLeese Drive and then flow into the Owen Sound Bay.

The native soils on the site generally consist of hard packed silt/clays over most of the property, with small pockets of sandy silt soils and cobbles on the east part of the site. The topography of the site is gentle with an average slope of approximately 1.0% towards the east. This encourages runoff from the site to drain via sheet flow over most of the site. There are a number of drainage ditches located throughout the site where the slope of land is steeper. These ditches however, disappear on the lower portion of the property on the east side of the property. Based on site inspections of the site, there are no visibly defined outlets discharging into Owen Sound Bay on the east side of the property.

COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)

TOWNSHIP OF GEORGIAN BLUFFS

A ridge crosses over most of the southern half of the property in a south to north direction and divides this portion of the site into two distinct elevation levels. Considerable soil erosion is occurring on the ridge as a result of runoff concentrating into channels as it flows down the face of the ridge. Runoff at the base tends to infiltrate rapidly into the sandy silt type soils found in this area. Overburden thickness here is very shallow (< 0.6 m in some areas) and is underlain by an impermeable layer of shale. Runoff infiltrating into the overburden soils drains in an eastward direction along the bedrock / overburden interface where it eventually drains into Owen Sound Bay. In some areas where the shale prevents positive drainage towards the bay, sub-surface water ponds to the surface creating temporary wetland areas.

A second ridge rises from the shoreline of Owen Sound Bay on much of the northern portion of the property. At its highest, this ridge is approximately 10 m to 12 metres above the lower shoreline. Overburden on top of the ridge is very shallow (< 0.6 m) and is underlain by impermeable shale bedrock. There is no distinct runoff discharge point along this ridge indicating that drainage from the northern portion of the site is by sheet flow and or infiltrated into the overburden soils.

There are numerous locations on the upper level of the site (west side) where runoff ponds in low lying areas. Due to the native silty clay soils, these areas remain wet throughout most of the spring and fall and encourage the growth of cattails and other wetland type vegetation.

There are five (5) culverts that drain the lands west of the Cobble Beach property on the west side of Grey Road 1. This catchment area does not drain into the Phase 1 and 2 drainage area. Runoff from this catchment area enters Ponds 1 and 4 located on the west side of the property. Pond 4 is interconnected to Pond 1 and will drain into Pond 1 under normal conditions. If Pond 4 surcharges, an emergency outlet will be provided on the east side of the pond which will outlet towards Snowberry Lane and discharge into the natural ravine area between Telford Lane and Algonquin Trail. Pond 1 outlets to the east via a drainage ditch which ultimately discharges into Owen Sound Bay.

Since all runoff from Stage 1 will discharge directly into Owen Sound Bay, there will be no requirement to over control the post-development flows from the site to meet pre-development peak flow conditions. Therefore, the pre-development flows for the site have not been modelled as part of this report.

2.3 POST DEVELOPMENT DRAINAGE CONDITIONS AND PROPOSED STORMWATER MANAGEMENT PLAN

2.3.1 Description of Proposed Land Uses

Stage 1 (2007) comprises of portions of Phases 1 and 2 of the proposed Cobble Beach development. Figure 2 provides details of the area that will be registered as part of the Stage 1 Development and will include:

- 18 Hole Championship Golf Course (already constructed)
- Golf Club House (27,484 ft²) including:
 - 210 Seat Restaurant
 - Pro Shop
 - Ten (10) Inn Hotel Rooms
 - Spa
- Residential
 - 72 residential units
 - 28 townhouse units
 - 92 multi-family units

As noted previously, the design of stormwater management facilities for Stage 1 (2007) will take into consideration the ultimate development associated with Phases 1 and 2 to ensure that these facilities can accommodate the entire development.

As Phase 3 (northern portion of site) will for the most part have an independent stormwater management facility (i.e. pond 5 at clubhouse), there is no need to undertake a detailed review/design of stormwater management facilities associated with the northern part of the development at this stage.

2.3.2 Road Cross Section

The development will consist of an extensive internal road network. All interior roads will be constructed to the Township's typical road cross section which utilizes concrete curb and gutter and storm sewers. A copy of the typical cross sections to be used for the various road allowance widths within the development are attached as Figures 3, 4 and 5 respectively.

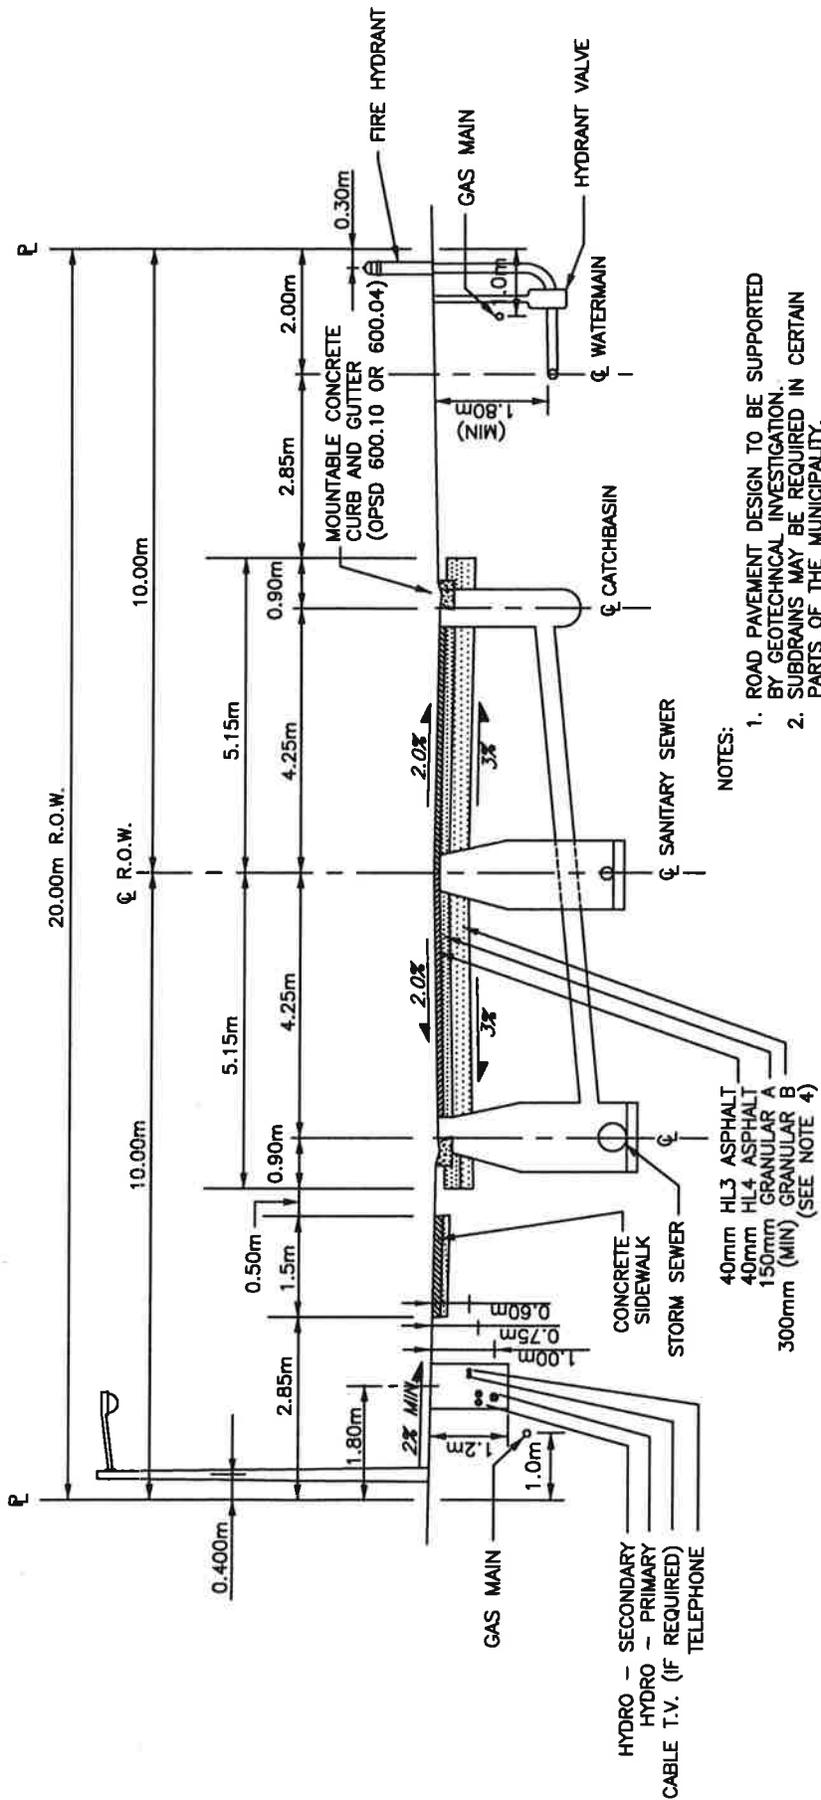

The road cross section also incorporates a storm sewer collection system. The storm sewer system for the development will be designed to convey the runoff generated by a 5 year design storm.

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

2.3.3 Post Development Drainage Conditions

All runoff from Phases 1 and 2, including Stage 1 (2007), will follow existing drainage patterns and drain eastward into Owen Sound Bay. The proposed development will increase the overall impervious level of the property to approximately 20%, thus increasing the quantity of runoff generated at the site. Since all stormwater runoff discharges directly into Owen Sound Bay, there will be no requirement to reduce the quantity of post-development runoff from the site to pre-development conditions.

- NOTES:
1. ROAD PAVEMENT DESIGN TO BE SUPPORTED BY GEOTECHNICAL INVESTIGATION.
 2. SUBDRAINS MAY BE REQUIRED IN CERTAIN PARTS OF THE MUNICIPALITY.
 3. PLACE 75mm TOPSOIL AND SEED OR SOD FROM EDGE OF SHOULDER TO PROPERTY LINE.
 4. ADDITIONAL GRANULAR "B" DEPTH MAY BE REQUESTED BY THE MUNICIPALITY.

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

The proposed minor flow system will consist of a storm sewer collection system that will be designed to convey the 5 year design storm event. The major flow system for Stage 1 (2007), which includes the remaining portions of Phase 1 and 2, will be conveyed by means of an overland flow route consisting of the subdivision roads and drainage ditches.

Phase 1 and 2 has been divided into thirteen catchment areas for modelling purposes. The catchment areas and flow directions for the minor system are delineated on Map 1 (back pocket). The catchment areas and flow direction for the major system are delineated on Map 2 (back pocket).

For the minor system, Catchments 201 to 206 drain the upper portion of Stage 1 to Pond 3. Catchment areas 207 to 209 drain the northern area of the lower portion of Stage 1 to Pond 2. Catchment areas 210 to 211 drain the southern area of the lower portion of the property directly into Owen Sound Bay. Catchment area 212 drains Timberglade Court southeast to the roadside ditch on Church Sideroad, which eventually discharges into Owen Sound Bay. Catchment area 213 will remain relatively undisturbed and will continue draining east into Georgian Bay. This catchment area will drain the rear yards of the houses located on the east side Timberglade Court as well as four lots on McLeese Drive.

The only difference between the major flow system and minor flow system is that Catchment Area 203 will by-pass the minor flow system outlet on the east side of the catchment area and flow directly into Catchment Area 210 for all storm events greater than the 5 year storm. Runoff will then discharge into the proposed drainage ditch from Pond 3 and continue flowing east into Owen Sound Bay.

Both stormwater management ponds have already been constructed as part of the golf course development. Pond 3 is located just below the bluff that separates the upper and lower portion of the development. This pond is approximately 11,500 m² in area and will provide stormwater quality control for Catchments 201 to 206. Pond 2 located east of Pond 3, is approximately 2,200 m² in area and will provide stormwater quality control for Catchments 207 to 209. The stormwater quality control provisions to be provided at the site will be discussed further in Section 2.3.5.

Both of the existing ponds will receive runoff from the 5 year and 100 year storm events. The outlets for each pond have been designed to accommodate the maximum peak flow. The outlets will be constructed as weirs placed into the side slope of the pond bank and protected with rip-rap. Outlet details for Ponds 2 and 3 are provided on Maps 3 and 4. Although quantity control will not be required, the configuration of each outlet will actually detain a portion of the runoff and reduce the overall peak flow discharging from each pond.

As will be discussed in Section 2.3.5, an orifice pipe will also be provided in the outlet of each pond. The size of the pipe has been designed to detain runoff during the stormwater quality storm event (2 yr. – 25 mm storm) for at least 24 hours as required by the Ministry of the Environment.

The hydrologic modeling software MIDUSS was used in conjunction with the Warton IDF rainfall curves to determine the peak flows and volume of runoff discharging into each pond. This model was then used to design the pond outlets. The parameters used in the model are contained in Appendix B.

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

The post development peak flows for the 2 yr. – 2 hr., 5 yr. – 6 hr. and 100 yr. – 6 hr. storm events are summarized in Table 1 below. Appendix C contains the MIDUSS output files for Ponds 2 and 3 during the 2 yr. – 2 hr. storm event. Appendices D and E contain the MIDUSS output files for the 5 yr. – 6 hr. and 100 yr. – 6 hr. storm event. Both ponds were modelled together during the 5 year and 100 year storm events.

**Table 2
Post Development Discharge Summary**

Storm Event	Pond 2 (m ³ /s)		Pond 3 (m ³ /s)	
	Inflow	Outflow	Inflow	Outflow
2 yr – 2hr.	0.25	0.03	0.66	0.09
5 yr – 6 hr.	1.03	0.51	3.66	1.32
100 yr – 6 hr.	2.77	2.10	9.64	7.73

Notes:

Pond #2 - Contributing catchments 207 – 209

Pond #3 - Contributing catchments 201 – 206

Catchment 203 will by-pass Pond 3 during the 100 yr. storm

Stormwater from Pond 2 will discharge directly into Owen Sound Bay. A spillway constructed out of large beach cobbles will line the spillway channel in order to prevent erosion of the side of the pond, as shown on Map 3.

Stormwater from Pond 3 will be directed under McLeese Drive at the south end of the pond and discharge into Owen Sound Bay, south of Pond 2. The spillway for Pond 3 will also be lined with large beach cobbles ($D_{50} = 450$ mm) in order to prevent erosion of the side of the pond, as shown on Map 4.

Drawings No. C9 to C34, which are a part of the Detailed Engineering Drawing set, are enclosed and provide details of the sizing of the storm sewer system and road crossing culverts for Stage 1 (2007), along with details of the storm sewer system in the remaining portion of Phase 1 and 2.

Appendix F provides the storm sewer calculations for Stage 1 (2007) and the remaining portions of Phase 1 and 2.

2.3.4 Major System Flow

The major system flow route for Phases 1 and 2 including Stage 1 (2007), will use the interior road system in combination with the existing drainage ditches located throughout the property. Where the flow route is directed from the roadway to the ditch, the road profile will be designed as a sag, which will allow runoff to overflow the curb into the ditch system. This will occur at Catchments 201, 202, 203, 205, 208 and 210.

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

The 100 year storm flow was modeled through all catchment areas, assuming the catchbasins were fully blocked to determine whether the runoff from this storm event could be safely conveyed within the road allowance. The Township's standard 20 metre road cross section comprising of a mountable curb and gutter (OPSD 600.100) was used in the model as this is the cross section that is proposed to be used throughout a majority of the development.

Based on the model results, the standard road cross section will be adequate to convey major flows on all side streets. The modelling indicates however that, a barrier type curb will be required on Sarawak Way on each side of the sag point, the lower portion of McLeese Drive east of Timberglade Court and along the entire length of Cobble Beach Drive in order to contain the runoff generated from the 100 year storm within the road allowance. Within the 30 metre section on McLeese Drive and Cobble Beach Drive, all major system flows will be contained within the road allowance.

Modeling results of the cross section analysis have been attached as Appendix G.

At the south end of Punksseed Lane, the existing drainage ditch will be widened to accommodate the runoff from Catchment Areas 201 to 206 which will outlet through Pond 3, and Catchment Areas 210 and 211.

The following provides a summary of the required ditch dimensions to accommodate the 100 year peak flow:

- Base Width = 2.0 m
- Side slopes = 3:1 (minimum)
- Depth = minimum 1.2 m

The entire length of drainage ditch shall be lined with a minimum D_{50} stone size of 450 mm.

2.3.5 Stormwater Quality Control

The 2003 *Stormwater Management Planning and Design Manual* (SWMP&D Manual, 2003) recommends that the required level of water quality protection be associated with the habitat sensitivity of the receiving watercourse. According to the Fishery Habitat study completed by SAAR Environmental Ltd. in support of the proposed development, the area where the proposed storm outfall is to be discharging into Owen Sound Bay is located along the portion of shoreline that consists of a Type 2 habitat that is capable of supporting Carp, Yellow Perch, Smallmouth Bass and perhaps Largemouth Bass. Based on the Type 2 habitat classification, a 'Normal' water quality protection level will be used.

A treatment train approach to stormwater quality management has been proposed for this development. This approach consists of three (3) levels of treatment classified as follows:

- Lot level control measures
- Conveyance control measures
- End-of-Pipe control measures

The treatment train measures proposed for the development are as follows:

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

2.3.5.1 Lot Level Control Measures

The impervious native soils located throughout the site precludes the use of drainage pits and infiltration trenches as lot level controls. Shallow lot grades will be utilized where possible to promote detention and settling of pollutants on individual lots. Maintaining existing drainage conditions by maintaining existing features will be the ultimate goal of lot level controls.

2.3.5.2 Conveyance Control Measures

Conveyance control measures for the Phase 1 and 2 including Stage 1 (2007), will be limited to grass swales located between each lot in order to promote natural filtration of solids, and infiltration into the soil where possible. Conveyance controls such as pervious storm sewer pipes (exfiltration) are not feasible for this development due to the imperviousness nature of the native soils.

2.3.5.3 End-of-Pipe Control Measures

The use of a wet pond was determined to be the most feasible end-of-pipe quality control measure at the site since this type of facility has the ability to accommodate large catchment areas. As discussed previously, the two ponds which have already been constructed as part of the golf course development will be used to provide the required water quality protection level for a majority of Stage 1 (2007).

These ponds were designed and constructed to provide sufficient active storage to detain the runoff from a 25 mm storm (simulated by a 2 year – 2 hour Chicago Storm Distribution) for 24 hours. The extended detention control device for Ponds 2 and 3 will each consist of a horizontal orifice pipe that will be constructed through the side of each pond. As previously discussed, both ponds will also be provided with outlets above the active storage level that will be designed to handle the 5 year and 100 year storm events.

The following summarizes the design details of Ponds 2 and 3. Refer to Map 3 and Map 4 for details of the extended detention control devices for each pond. The MIDUSS output file for the design of the outlet structures for each pond are included as Appendix C.

Please note that the ponds have been designed for the ultimate development of Phase 1 and 2.

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

Catchment Areas 210, 211, 212 and 213 will not be directed into either of the stormwater quality ponds. Quality control for these areas will be handled as follows:

Catchment Area 210

This catchment area comprises of two multi-family blocks and approximately 435 m of paved roads. The total imperviousness of this catchment area is approximately 44% and therefore, quality control is required to meet the MOE's normal protection level due to the high imperviousness of the catchment area.

Since this area cannot drain into either of the stormwater management ponds, it is proposed to install an oil-grit separator at the sag point of McLeese Road to achieve the required protection level prior to discharging stormwater into the downstream drainage ditch on the east side of McLeese Drive.

As this catchment area will be part of Stage 2, the design of the oil-grit separator system will be completed during the final design of this portion of the subdivision.

Catchment Area 211

This catchment area drains the southern end of Punkinseed Lane into an existing drainage ditch located at the end of the proposed cul-de-sac.

Since this area cannot drain into either of the stormwater management pond and the imperviousness of the drainage area is approximately 22% with only 12% being directly connected to the drainage system, it is proposed not to install an end-of-pipe stormwater control system for this area. Runoff from this catchment area will drain into the existing ditch system which then drains east into Georgian Bay. All catchbasins located in this area will be provided with 600 mm sumps to assist in removing larger sediments from the runoff.

Catchment Area 212

This catchment area drains the Timberglade Court drainage area south into the existing drainage ditch located on the north side of Church Side Road.

Since this area cannot drain into either of the stormwater management ponds and the imperviousness of this drainage area is approximately 25% with only 15% being directly connected to the drainage system, it is proposed not to install an end-of-pipe stormwater control system for this area.

Runoff from this catchment area will drain into the existing ditch system which then drains east into Georgian Bay. The total length of ditch is 100 m. It is proposed to re-shape this ditch and re-vegetate it in order to promote filtering of sediments from the runoff generated from this area. In addition, all catchbasins located in this area will be provided with 600 mm sumps to assist in removing larger sediments from the runoff.

Catchment Area 213

This catchment area will remain mostly undisturbed. No end-of-pipe stormwater quality control measures are proposed as no directly connected impervious areas drain into this area.

The rear yards of the lots fronting onto Timberglade Court and three lots on the east side of McLeese Drive will drain into this area as well as a portion of the houses associated with these lots. The runoff from the rear yards and roof tops of the houses will generally be of good quality.

The undisturbed wooded area will assist in filtering and settling out any sediments that may be contained in the runoff from this area prior to discharging off-site.

Please note that Catchment Areas 210, 212 and 213 are within the Stage 2 development boundary area.

3.0 FUTURE DEVELOPMENT

Future phases of the Cobble Beach development will comprise of a third phase of residential development located on the north side of the site and a Village Centre, which will be located on the east side of Owen Sound Bay, north of Pond 2 (See Map 1).

These future phases will require a separate Stormwater Management Plan to be prepared that will address both quantity and quality control. As shown on Map 1, Pond 5 has been constructed north of Pond 2 on the east side of the site. This pond will accommodate the quality control requirements for Phase 3. Similar to Phase 1 and 2, it has been assumed that quantity control will not be required for this phase and that direct discharge of the post-development peak flow into Owen Sound Bay will be permitted.

For the Village Centre area, quality control is proposed to be address with the use of oil-grit separators due to the lack of sufficient space to construct a wet pond. Quantity control is not expected to be required for this area as runoff will be discharged directly into Owen Sound Bay similar to the other phases.

4.0 EROSION AND SEDIMENTATION CONTROL

During construction of Stage 1 (2007), sedimentation and erosion control will be very important in order to prevent fine silt and clay materials from migrating to Owen Sound Bay.

As part of the construction of the Cobble Beach Golf Course over the past two years, a detailed Erosion and Sedimentation Control Plan was prepared and implemented throughout the duration of construction in order to prevent the erosion of materials into the Owen Sound Bay. It is proposed to continue with this detailed plan and amend it as required to suit the construction of the interior subdivision streets and residential dwellings.

The following erosion and sedimentation control measures will be used during construction of Stage 1 (2007)

Sediment Control

Heavy duty silt fencing will be placed in intermittent drainage paths downstream from the construction site as identified on Map 5 (back pocket). A sedimentation pond will also be constructed in the future Village Centre area to assist in the removal of sediments prior to discharging runoff into Owen Sound Bay during construction of Stage 1.

It will be important to monitor the performance of the sediment control facilities and to make modifications as necessary to prevent sediment transport from the construction sites.

In addition, on exposed slopes it is proposed to scarify the ground surface. The scarification will be a series of low soil walls or terraces constructed perpendicular to the direction of drainage flow. The terraces will slow surface drainage and reduce erosion preventing washouts and gulley formation.

Stock Piled Fill / Topsoil

Stock piled fill or topsoil will be protected using a perimeter silt fence. Topsoil stockpile areas are shown on Map 5.

In addition to the above, the following erosion and sedimentation control measures are to be implemented.

- Silt fencing and other erosion control measures will be inspected on a regular basis and after each storm event and repaired as required.
- The sides of all subdivision roads will be seeded immediately after construction is completed. In areas where steep slopes are located, the use of erosion control blankets in combination with seed will be used.

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

- Filter cloth placed under all catchbasin grates until the adjacent street is paved.
- All storm outfalls will be protected from erosion by placement of riprap placed on geotextile cloth.
- Re-vegetation of all developed lots by either seeding or sodding will be completed immediately after construction has been completed.

5.0 CONCLUSION

Based on the findings of the above report, the following conclusions are made:

1. Stormwater quantity control of post-development runoff is not required for the subdivision. The minor and major flow systems will direct all runoff into Owen Sound Bay. A majority of the flow from the Stage 1 will be conveyed through two ponds (Ponds 2 and 3) prior to discharging into the bay.
2. The area of Owen Sound Bay immediately east of the development has been classified as a Type 2 fish habitat. A 'Normal' protection level for all runoff leaving the site will therefore be provided to meet the Ministry of the Environment's guidelines for protecting Type 2 habitat.
3. Stormwater quality control for a majority of the development will be provided by the two existing ponds which will function as extended detention wet ponds.
4. An extended detention control device at the outlet of Ponds 2 and 3 will provide 24 hour drawdown of the volume of runoff to be generated under a 25 mm storm event.
5. Storm runoff will be conveyed through the development by means of a minor flow system designed to convey the 5 year storm event. The minor flow system will consist of closed pipe storm sewer system in combination with existing drainage ditches.
6. A spillway will be constructed at the outlet of each pond that will convey flows in excess of the 25 mm event. The first stage of the weir will convey storm events up to and including the 5 year event while the second stage will convey storms exceeding the 5 year event up to and including the 100 year storm event.
7. Flow from Pond 3 will be directed under McLeese Drive via two 1200 mm culverts. These culverts have been designed to handle the 25 year storm event.
8. The major flow system will consist of the proposed streets in combination with the existing drainage ditches located throughout the development. Stormwater modelling indicates that the Township's standard 20 m cross section using mountable curb is adequate for the side streets. A barrier type curb will be required at the south end of Sarawak Way on both sides of the sag point, along the entire lower section of McLeese Drive east of Timberglade Court and along the entire length of Cobble Beach Drive in order to contain stormwater runoff within the road allowance.
9. Future phases of the development will consist of Phase 3 and a Village Centre. Stormwater Management Plans will be required to be prepared once these developments are submitted for Draft Plan approval. Pond 5 has been constructed as part of the golf course development and will be incorporated into the stormwater management plan for Phase 3 to address the quality control requirements for this phase of the development. It is proposed to incorporate Oil Grit Separators to meet the quality control requirements for the Village Centre portion of the development.

**COBBLE BEACH DEVELOPMENT – STAGE 1 (2007)
STORMWATER MANAGEMENT REPORT (FINAL)**

TOWNSHIP OF GEORGIAN BLUFFS

10. Quantity control for both future phases is assumed not to be required as runoff will discharge directly into Owen Sound Bay.
11. Erosion and sedimentation control measures as detailed in this report, will be implemented during the site servicing of the development and once house construction commences.

All of which is respectfully submitted,
