Revision Number	Date	Comments
Rev.0	December 2015	Original TIS Submission
Rev.1	February 2016	TIS Update Submission
Rev.2	June 2016	TIS Update Submission
Rev.3	January 2020	TIS Update Submission

1.0 Executive Summary

Crozier Consulting Engineers (Crozier) was retained by Flato Developments Inc. (Flato) to complete an updated Traffic Impact Study (TIS) to support the Official Plan Amendment, Zoning By-law Amendment, Redline Draft Plan and Site Plan Applications for a proposed commercial block located within the Dundalk Meadows development (the site) (now referred to as Edgewood Greens) in Dundalk, Township of Southgate.

The original TIS was submitted in December 2015 to the Ontario Ministry of Transportation (MTO) and Township of Southgate. The first update was prepared in response to discussions with MTO and to reflect the additional lands acquired by Flato (Flato North). Subsequent updates were completed in February 2016 and June 2016 in response to comments provided by the MTO. Flato West has been constructed and occupied, Flato North is currently under construction, a portion of Flato East has been constructed and the remaining lands are Draft Plan Approved and are undergoing detailed design.

A proposed commercial block will replace 33 townhouse units in Phases 12 and 13. The commercial building is proposed to have a gross floor area (GFA) of 1,635 square metres (17,599 square feet). The development includes 80 parking spaces and two loading spaces. The addition of the commercial block increases the distance between Highway 10 and the closest internal street intersection from approximately 30 metres to approximately 110 metres as it results in the removal of the Street "H" and Street "G" intersection illustrated in the Concept Plan (Colgan Crescent/Milliner Avenue on the Phasing Plan).

With the inclusion of the commercial block and the removal of the constructed units, the total outstanding unit breakdown is now as follows:

- 477 Single-detached Units
- 219 Semi-detached Units
- Commercial Building with a GFA of 1,635 m² (17,599 ft²)

The analysis contained within this report included the following intersections:

- Highway 10 & Main Street,
- Main Street & Russell Street,
- Main Street & Mill Street/ Alice Street,
- Main Street & Osprey Street,
- Victoria Street & Elm Street, and
- Highway 10 & the proposed public road access.

Analysis of the 2019 existing traffic operations at the study intersections indicates that the intersections are operating with a LOS "B" or better in the weekday a.m. and p.m. peak hours, with reserve capacity for increase in traffic volumes.

The development is expected to be fully built-out by 2025, accordingly, the 2025, 2030 and 2035 horizon years were analysed, reflecting the full build-out and 5 - and 10-year horizons. For consistency with the previous submissions, a growth rate of 1.5 percent compounded annually was applied to all movements on the boundary road network.

Analysis of the 2025 through 2035 future background conditions indicate that the study intersections are expected to continue operating with a LOS "B" or better, with the exception of Main Street and Alice Street/ Mill Street, which is expected to operate with a LOS "C" in the p.m. peak hour.

The development is forecasted to generate 460 and 618 two-way primary trips in the weekday a.m. and p.m. peak hours, respectively, and 0 and 23 pass-by trips in the a.m. and p.m. peak hours, respectively.

The analysis of the study intersections under future total traffic volume conditions indicates the following:

- An auxiliary northbound left-turn lane with a minimum of 40 meters storage length is warranted at the Highway 10 site access.
- The intersection of Highway 10 & Main Street, Main Street & Russell Street, and Elm Street and Victoria Street are expected to continue operating with a LOS "B" or better in all time periods.
- The intersection of Main Street and Alice Street/ Mill Street, Main Street and Osprey Street, and Highway 10 and the proposed site access are expected to operate with a LOS "C" or better in all time periods.
- The addition of the site generated traffic is expected to result in a maximum control delay increase of 3.4 seconds (a.m. Osprey Street) and a maximum volume-to-capacity ratio increase of 0.16 (NB, a.m. – Russell Street).

The available stopping and intersection sight distance on Highway 10 to the north and south of the site access exceeds the minimum requirements outlined in the TAC GDGCR.

It is concluded that the traffic generated by the proposed residential and commercial development can be accommodated by the boundary road network, within the noted improvement.

The analysis undertaken herein was prepared using the most recent Draft Plans and Concept Plan (dated November 22, 2019). Any minor changes to the Plans will not materially affect the conclusion contained within this report.

The proposed development can be supported from a traffic operations perspective, with the implementations of the noted improvement.

2.0 Introduction

2.1 Background

Crozier Consulting Engineers (Crozier) was retained by Flato Developments Inc. (Flato) to complete an updated Traffic Impact Study (TIS) to support the Official Plan Amendment, Zoning By-law Amendment, Redline Draft Plan and Site Plan Applications for a proposed commercial block located within the Dundalk Meadows development (now referred to as Edgewood Greens) in Dundalk, Township of Southgate.

The original TIS was submitted in December 2015 to the Ontario Ministry of Transportation (MTO) and Township of Southgate. The first update was prepared in response to discussions with MTO and to reflect the additional lands acquired by Flato (Flato North). Subsequent updates were completed in February 2016 and June 2016 in response to comments provided by the MTO. Since these updates, Flato North, East and West have been Draft Plan Approved. Flato West has been constructed and occupied, Flato North is currently under construction, a portion of Flato East has been constructed and the remaining lands are Draft Plan Approved and undergoing detailed design.

2.2 Development Proposal

As described above, Edgewood Greens (formerly Dundalk Meadows) is divided into three properties (North, West and East) and 13 Phases, all of which have been Draft Plan Approved. The development details and the status of each of the Draft Plan Approved Phases are summarized in **Table 1** below.

Table 1: Edgewood Greens Development Details and Status

Phase	Development Property	Units	Approval Status
Phase 1	Flato West	70	Constructed and Occupied
Phase 2B	Flato East	38	Constructed and Occupied
Phases 2A and 3-6	Flato North	267	Draft Plan Approved/ Under Construction
Phases 7, 8	Flato East	141	Draft Plan Approved/ Under Detailed Design
Phases 9-13	Flato East	321	Draft Plan Approved/ Subject to Future Detailed Design
Total		837	

The residential units will consist of a combination of single-detached units and semi-detached units. A total of 585 single-detached units and 252 semi-detached units were Draft Plan Approved in Flato North, West and East.

As noted above, Phase 1 and 2B were constructed and occupied at the time of undertaking the turning movement counts. As such, the trips generated by these dwelling units have been captured in the 2019 existing traffic volumes.

The proposed commercial block will replace 33 semi-detached units in Phases 12 and 13. The commercial building is proposed to have a gross floor area (GFA) of 1,635 square metres (17,599 square feet). The development includes 80 parking spaces and two loading spaces. The addition of the commercial block increases the distance between Highway 10 and the closest internal street intersection from approximately 30 metres to approximately 110 metres as it results in the removal of

the Street "H" and Street "G" intersection illustrated in the Concept Plan (Colgan Crescent/Milliner Avenue on the Phasing Plan).

With the inclusion of the commercial block and the removal of the constructed units, the total outstanding unit breakdown is now as follows:

- 477 Single-detached Units
- 219 Semi-detached Units
- Commercial Building with a GFA of 1,635 m² (17,599 ft²)

The Edgewood Greens development has three access points to the boundary road network. A direct connection is provided to Highway 10, access to Main Street is provided through Russell Street, and Hagan Street provides access to Elm Street which in turn connects with Victoria Street.

Access to the commercial block is proposed through two full-moves entrances to Street "G" (Colgan Crescent) and Street "H" (Milliner Avenue). Street "H" will intersect with Highway 10 to the east. The latest Phasing Plan has been included as **Figure 1** and the Concept Plan for the commercial block has been included as **Figure 2**.

2.3 Purpose and Scope

The purpose of the study is to evaluate the transportation-related impacts of the proposed development on the boundary road network and to recommend or confirm any required mitigation measures, if warranted. Previous versions of the TIS had recommended a northbound left-turn lane on Highway 10 at the public road entrance to the site.

The study reviews the following main aspects of the proposed development from a transportation engineering perspective:

- Existing, future background, and future total traffic operations on the boundary road network during the weekday a.m. and p.m. peak hours;
- Forecasted trip generation of the proposed development; and,
- Minimum sight distance and auxiliary turn-lane requirements.

The study has been completed in accordance with the MTO's "Guidelines for the Preparation of Traffic Impact Studies" (September 2014).

3.0 Existing Conditions

3.1 Development Lands

The site is bound by Highway 10 to the northeast, active agricultural lands/mixed woods to the southeast and existing residential dwellings to the northwest. Flato West is located in the southwest portion of the site and has been fully built-out. The Site Location Plan has been included as **Figure 3**.

3.2 Study Intersections

The Traffic Impact Study analyzes the following intersections:

- Highway 10 and Main Street
- Main Street and Russell Street
- Main Street and Alice Street/Mill Street

- Main Street and Osprey Street
- Elm Street and Victoria Street
- Highway 10 and the proposed public road access

Details relating to the boundary roadways are summarized in the subsequent section. **Figure 4** illustrates the existing traffic control and lane configuration at the study intersections.

3.3 Boundary Road Network

Due to the skewed nature of the roadway, the directional orientation of the boundary road network is ambiguous. Accordingly, to provide clarity throughout the report, Highway 10, Russell Street, Alice Street/Mill Street, Osprey Street and Elm Street have been given a north-south orientation and Main Street and Victoria Street have been given an east-west orientation.

Highway 10 is a north-south two-way highway under the jurisdiction of the MTO. Highway 10 has a posted speed limit of 80 km/h. The roadway consists of two approximate 3.7 metre travel lanes with granular shoulders. No pedestrian facilities exist on either side of this highway.

Main Street (Grey County Road 9) is an east-west two-lane two-way arterial roadway under the jurisdiction of the Grey County. Main Street has a posted speed limit of 50 km/h. The roadway consists of two approximate 3.7 metre travel lanes with curb and gutter along both the north and south sides. Approximate 1.5 metre concrete pedestrian sidewalks exist along the north and south sides of Main Street.

Russell Street is a north-south two-lane two-way local roadway under the jurisdiction of the Township of Southgate. There is no posted speed limit; thus, the speed limit is assumed to be 50 km/h. The roadway consists of two approximate 3.2 metre travel lanes with curb and gutter to the east and west. On the east side of the roadway, approximate two metre grass strip separates an approximate 1.5 metre sidewalk from the curb.

Alice Street is a north-south two-lane two-way local roadway under the jurisdiction of the Township of Southgate. There is no posted speed limit; thus, the speed limit is assumed to be 50 km/h. The roadway consists of two approximate 3.2 metre travel lanes with asphalt swales to the east and earthen swales to the west. An approximate 1.5 metre concrete sidewalk exists on the east side of the roadway.

Mill Street is a north-south two-lane two-way local roadway under the jurisdiction of the Township of Southgate. It is offset approximately 15 metres westward from Alice Street. There is no posted speed limit; thus, the speed limit is assumed to be 50 km/h. The roadway consists of two approximate 3.2 metre travel lanes with asphalt swales to the west and earthen swales to the east. On the west side of the roadway, an approximate two metre grass strip separates an approximate 1.5 metre sidewalk from the curb.

Elm Street is a north-south two-lane two-way local roadway under the jurisdiction of the Township of Southgate. There is no posted speed limit; thus, the speed limit is assumed to be 50 km/h. The roadway consists of two approximate 3.2 metre travel lanes with earthen swales to the east and west. No pedestrian facilities exist on this section of roadway.

Victoria Street is an east-west two-lane two-way local roadway under the jurisdiction of the Township of Southgate. There is no posted speed limit; thus, the speed limit is assumed to be 50 km/h. The roadway consists of two approximate 3.5 metre travel lanes with an approximate 2.0 metre grass boulevard with a 1.5 metre concrete sidewalk.

Osprey Street is a north-south two-lane two-way local roadway under the jurisdiction of the Township of Southgate. There is no posted speed limit; thus, the speed limit is assumed to be 50 km/h. South of Main Street, the roadway consists of two approximate 3.5 metre travel lanes with asphalt swales and approximate 1.5 metre concrete sidewalks on the east and west sides. North of Main Street, the roadway consists of approximate 3.5 metre travel lanes approximate 1.5 metre concrete sidewalk on the east side of the roadway.

The signalized intersection of Highway 10 and Main Street is semi-actuated with left turn lanes in all approaches and crosswalks approximately two metres in width. The intersections of Main Street and Russell Street, Main Street and Mill Street/ Alice Street, Victoria Street North and Elm Street, and Main Street and Osprey Street are two-way stop-controlled with no dedicated turn lanes. **Figure 4** illustrates the existing boundary road network, including lane configurations and intersection control.

3.4 Traffic Data

Turning movement counts were conducted by Spectrum Traffic Data Inc. (Spectrum) staff at the study intersections on Thursday, December 19, 2019 between 6:00 a.m. – 10:00 a.m. and 3:00 p.m. – 7:00 p.m. Intersection analysis was conducted utilizing peak hour factors (PHFs) as calculated for each intersection during each time period. **Table 2** outlines the calculated peak hour factors at each intersection during each peak hour. The traffic count data is contained in **Appendix A**. **Figure 5** illustrates the 2019 existing traffic volumes that were recorded.

Table 2: Peak Hour Factors

Intersection	Peak Hour	Peak Hour Factor
Highway 10 and Main Street	Weekday A.M. 8:30 a.m. to 9:30 a.m.	0.88
	Weekday P.M. 4:45 p.m. – 5:45 p.m.	0.91
Main Street and Russell Street	Weekday A.M. 8:30 a.m. to 9:30 a.m.	0.96
	Weekday P.M. 4:45 p.m. – 5:45 p.m.	0.92
Main Street and Alice Street/Mill Street	Weekday A.M. 8:30 a.m. to 9:30 a.m.	0.92
	Weekday P.M. 3:45 p.m. – 4:45 p.m.	0.92
Main Street and Osprey Street	Weekday A.M. 8:30 a.m. to 9:30 a.m.	0.97
	Weekday P.M. 3:45 p.m. – 4:45 p.m.	0.92
Elm Street and Victoria Street	Weekday A.M. 8:30 a.m. to 9:30 a.m.	0.69
	Weekday P.M. 3:15 p.m. – 4:15 p.m.	0.86

3.5 Traffic Modelling

The boundary road network was modelled in Synchro 9.0 using existing roadway geometrics, collected traffic data, and default modelling parameters such as ideal saturation flow rates and lost time values. The signal timing plan was obtained from MTO staff and has been utilized for the existing, future background and future total analyses. 95th percentile queue lengths were derived from Synchro.

The assessment of intersections is based on the "Highway Capacity Manual (HCM)" methodology. Intersections are assessed using a Level of Service (LOS) metric with ranges of delay assigned a letter from "A" to "F"; "A" representing low delays and "F" representing heavy delays. The LOS definitions for signalized and unsignalized intersections are included in **Appendix B**.

3.6 Intersection Operations

The existing operations at the study intersections were analyzed using the existing 2019 traffic volumes illustrated in **Figure 5**. Detailed capacity analysis worksheets are included in **Appendix C**. **Table 3** outlines the 2019 existing traffic operations.

Table 3: 2019 Existing Levels of Service

Intersection	Control	Peak Hour	Level of Service ¹	Control Delay	Maximum v/c ratio ²	95 th Percentile Queues > Storage
Highway 10 and Main Street	Signal	A.M.	B	10.0 s	0.28 (EBL)	None
		P.M.	A	9.9 s	0.33 (EBT)	None
Main Street and Russell Street	Two-way Stop	A.M.	A	9.6 s	0.05 (NB)	None
		P.M.	B	10.3 s	0.05 (NB)	None
Main Street and Alice Street/Mill Street	Two-way Stop	A.M.	B	10.1 s	0.04 (NB)	None
		P.M.	B	11.8 s	0.04 (NB)	None
Main Street and Osprey Street	Two-way Stop	A.M.	B	10.5 s	0.03 (SB)	None
		P.M.	B	11.7 s	0.03 (SB/NB)	None
Elm Street and Victoria Street	Two-way Stop	A.M.	A	9.0 s	0.06 (NB)	None
		P.M.	A	8.9 s	0.02 (NB)	None

Note¹: The Level of Service of a signalized intersection is based on the average control delay per vehicle (Synchro/ICU).
The Level of Service of a two-way stop-controlled intersection is based on the delay associated with the critical minor road approach (HCM 2000).

Note²: The maximum v/c ratio for two-way stop-controlled intersections represents the maximum v/c for the minor road approach movements at the intersection. Any movements that experience a v/c ratio in excess of 0.85 are considered critical per the MTO TIS Guidelines.

The metrics summarized above indicate that the study intersections operate at a LOS "B" or better in the weekday a.m. and p.m. peak hours. The maximum volume-to-capacity ratio of 0.33 (Highway 10 and Main Street, EBT, p.m.) indicates that the study intersections have reserve capacity for increases in traffic volumes. All 95th percentile queues can be contained within their respective auxiliary turn-lanes.

4.0 Future Background Conditions

4.1 Horizon Years

For the purpose of this assessment, it has been assumed that the entirety of Edgewood Greens will be built out by 2025. The MTO's guidelines require analysis of the full build-out horizon and the five- and ten-year horizons from the estimated year of full build-out. Therefore, the 2025, 2030 and 2035 horizon years were analyzed.

4.2 Growth Rate

The MTO's "Provincial Highways Traffic Volumes 1988-2016" document was reviewed to analyze historical traffic volumes on Highway 10. The document provides historical traffic data for the segment of Highway 10 between Shelburne and Flesherton. A growth rate of 0.57 percent compounded annually was calculated for the Annual Average Daily Traffic (AADT) between 2010 and 2016.

For the purpose of a conservative analysis, and to be consistent with the previous submissions of the TIS, a growth rate of 1.5 percent compounded annually was applied to all movements on the boundary road network to forecast 2025, 2030 and 2035 future background traffic volumes. **Appendix D** contains the growth rate analysis. The 2025, 2030 and 2035 future background traffic volumes are illustrated in **Figures 6, 7 and 8**, respectively.

4.3 Future Road Improvements

No capacity improvements have been identified for the boundary roads within the study horizons. Any external improvements triggered by the proposed development are discussed in **Section 5**.

4.4 Background Developments

The Glenelg residential development is located at 231 Glenelg Street in the northwest end of Dundalk. The development has been Draft Plan Approved and is currently undergoing detailed design, with construction scheduled to commence summer 2020. The development proposal includes 130 single detached units and 33 townhouse units.

Crozier completed the Glenelg TIS in September 2018. The report was based on an earlier version of the plan that proposed 127 single family detached units and 26 townhouse units. An updated trip generation estimate has been provided in **Table 4** which accounts for the additional ten units proposed.

Table 4: Glenelg Trip Generation

Use	Trip Type	Peak Hour	Number of Trips		
			Inbound	Outbound	Total
L.U. 210: Single Family Detached Housing (130 Units)	Primary	Weekday A.M.	24	73	97
	Primary	Weekday P.M.	82	49	131
L.U. 220: Multifamily Housing (Low-Rise) (33 Units)	Primary	Weekday A.M.	4	13	17
	Primary	Weekday P.M.	14	8	22
Total	Primary	Weekday A.M.	28	86	114
	Primary	Weekday P.M.	96	57	153

Trips generated by Glenelg were assigned to the boundary road network based on the distributions described in the original TIS (Crozier, September 2018). 50 percent of trips were assumed to travel to and from the south on Highway 10 and ten percent of trips were assumed to travel to and from the east on Grey Road 9. These remaining trips were assumed to remain within Dundalk or travel to and from the north on Ida Street or to and from the west on Grey Road 9. The trips travelling to and from the east on Grey Road 9 and to and from the south on Highway 10 were assigned as through volumes on Main Street at the study intersections. The trips assignment for the Glenelg Development is illustrated in **Figure 6** and relevant excerpts from the Glenelg TIS, as well as the most recent Draft Plan have been included in **Appendix E**.

4.5 Intersection Operations

The future background operations at the study intersections were analyzed using the 2025, 2030 and 2035 future background traffic volumes illustrated in **Figures 7, 8 and 9**, respectively. Detailed capacity analysis worksheets are included in **Appendix C. Table 5, Table 6 and Table 7** outline the 2025, 2030 and 2035 future background traffic operations, respectively.

Table 5: 2025 Future Background Levels of Service

Intersection	Control	Peak Hour	Level of Service ¹	Control Delay	Maximum v/c ratio ²	95 th Percentile Queues > Storage
Highway 10 and Main Street	Signal	A.M.	B	10.2 s	0.40 (EBT)	None
		P.M.	B	11.6 s	0.45 (EBT)	None
Main Street and Russell Street	Two-way Stop	A.M.	A	9.8 s	0.06 (NB)	None
		P.M.	B	10.4 s	0.05(NB)	None
Main Street and Alice Street/Mill Street	Two-way Stop	A.M.	B	10.8 s	0.05 (NB)	None
		P.M.	B	13.4 s	0.05 (NB)	None
Main Street and Osprey Street	Two-way Stop	A.M.	B	11.3 s	0.04 (SB)	None
		P.M.	B	13.3 s	0.04 (SB)	None
Elm Street and Victoria Street	Two-way Stop	A.M.	A	9.1 s	0.06 (NB)	None
		P.M.	A	9.0 s	0.03 (NB)	None

Note¹: The Level of Service of a signalized intersection is based on the average control delay per vehicle (Synchro/ICU).
The Level of Service of a two-way stop-controlled intersection is based on the delay associated with the critical minor road approach (HCM 2000).

Note²: The maximum v/c ratio for two-way stop-controlled intersections represents the maximum v/c for the minor road approach movements at the intersection. Any movements that experience a v/c ratio in excess of 0.85 are considered critical per the MTO TIS Guidelines.

Table 6: 2030 Future Background Levels of Service

Intersection	Control	Peak Hour	Level of Service ¹	Control Delay	Maximum v/c ratio ²	95 th Percentile Queues > Storage
Highway 10 and Main Street	Signal	A.M.	B	10.4 s	0.41 (EBT)	None
		P.M.	B	12.1 s	0.48 (EBT)	None
Main Street and Russell Street	Two-way Stop	A.M.	A	9.9 s	0.06 (NB)	None
		P.M.	B	10.6 s	0.05 (NB)	None
Main Street and Alice Street/Mill Street	Two-way Stop	A.M.	B	11.0 s	0.05 (NB)	None
		P.M.	B	13.9 s	0.06 (NB)	None
Main Street and Osprey Street	Two-way Stop	A.M.	B	11.4 s	0.04 (SB)	None
		P.M.	B	13.6 s	0.05 (SB)	None
Elm Street and Victoria Street	Two-way Stop	A.M.	A	9.1 s	0.07 (NB)	None
		P.M.	A	9.1 s	0.04 (NB)	None

Note¹: The Level of Service of a signalized intersection is based on the average control delay per vehicle (Synchro/ICU).
The Level of Service of a two-way stop-controlled intersection is based on the delay associated with the critical minor road approach (HCM 2000).

Note²: The maximum v/c ratio for two-way stop-controlled intersections represents the maximum v/c for the minor road approach movements at the intersection. Any movements that experience a v/c ratio in excess of 0.85 are considered critical per the MTO TIS Guidelines.

Table 7: 2035 Future Background Levels of Service

Intersection	Control	Peak Hour	Level of Service ¹	Control Delay	Maximum v/c ratio ²	95 th Percentile Queues > Storage
Highway 10 and Main Street	Signal	A.M.	B	10.6 s	0.42 (EBT)	None
		P.M.	B	12.6 s	0.50 (EBT)	None
Main Street and Russell Street	Two-way Stop	A.M.	B	10.1 s	0.07 (NB)	None
		P.M.	B	10.8 s	0.06 (NB)	None
Main Street and Alice Street/Mill Street	Two-way Stop	A.M.	B	11.3 s	0.06 (NB)	None
		P.M.	C	15.2 s	0.07 (NB)	None
Main Street and Osprey Street	Two-way Stop	A.M.	B	11.8 s	0.04 (SB)	None
		P.M.	B	14.2 s	0.06 (SB)	None
Elm Street and Victoria Street	Two-way Stop	A.M.	A	9.2 s	0.07 (NB)	None
		P.M.	A	9.2 s	0.04 (NB)	None

Note¹: The Level of Service of a signalized intersection is based on the average control delay per vehicle (Synchro/ICU).

The Level of Service of a two-way stop-controlled intersection is based on the delay associated with the critical minor road approach (HCM 2000).

Note²: The maximum v/c ratio for two-way stop-controlled intersections represents the maximum v/c for the minor road approach movements at the intersection. Any movements that experience a v/c ratio in excess of 0.85 are considered critical per the MTO TIS Guidelines.

The metrics summarized above indicate that the study intersections are expected to continue operating with a LOS "B" or better, with the exception of Main Street and Alice Street/Mill Street, which is expected to operate with a LOS "C" in the weekday p.m. peak hour. The maximum volume-to-capacity ratio of 0.50 (Highway 10 and Main Street, EBT, p.m.) indicates that the intersections have reserve capacity for increases in traffic volumes. The 95th percentile queues through all horizon years and peak hours can be contained within their available storage lengths.

5.0 Future Total Conditions

5.1 Site Generated Traffic

The proposed mixed-use development will result in additional vehicles on the boundary road network that would otherwise not exist. The proposed development will also result in additional turning movements at the study intersections.

As noted, the remainder of the development is proposed to consist of the following:

- 477 Single-detached Units
- 219 Semi-detached Units
- Commercial Building with a GFA of 1,635 m² (17,599 ft²)

The trip generation of the proposed residential dwelling and commercial units was forecasted using published data from the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition. The ITE Trip Generation Manual is a compendium of industry collected trip generation data across North America for a variety of land uses and is used industry-wide as a source for trip generation forecasts.

The applicable average rates and fitted curve equations for Land Use Category (LUC) 210 “Single Family Detached Housing” and LUC 220 “Multifamily Housing (Low-Rise)” were applied to the proposed residential dwelling units, and the average rates for LUC 820 “Shopping Centre” were applied to the proposed commercial GFA.

As defined by the ITE Trip Generation Handbook, 3rd Edition, primary trips are made for the specific purpose of visiting the generator. Pass-by trips are made as intermediate stops on the way from an origin to a primary destination without a route diversion. Accordingly, these vehicles do not increase the volume of vehicles on the roadway.

The pass-by trip percentage of the commercial retail pass-by trips was forecasted using the rates provided by the ITE Trip Generation Handbook. LUC 820 was used to establish a pass-by percentage of 34 percent for the p.m. peak period. A pass-by percentage was not applied to the a.m. peak period as this trip generation generally captures employees of the commercial uses.

Relevant excerpts from the ITE Trip Generation Manual, 10th Edition and ITE Trip Generation Handbook, 3rd Edition have been included in **Appendix I**. The forecasted trip generation of the mixed-use development is summarized in **Table 8**.

Table 8: Trip Generation

Land Use	Units/GFA	Peak Hour	Trip Type	Trips Generated			
				Inbound	Outbound	Total	
LUC 210: Single Family Detached Housing	477 Units	A.M.	Primary	85	258	343	
		P.M.		287	168	455	
LUC 220: Multifamily Housing (Low-Rise)	219 Units	A.M.	Primary	23	77	100

LUC 820: Shopping Centre	17,599 ft ²	A.M.	Primary	10	7	17	
			Pass-by	0	0	0	
		P.M.	Primary	21	23	44	
			Pass-by	11	12	23	
Total		A.M.	Primary	118	342	460	
			Pass-by	0	0	0	
		P.M.	Primary	383	235	618	
			Pass-by	11	12	23	

5.2 Trip Distribution and Assignment

5.2.1. Residential Trips

The trips generated by the proposed residential portion of the development were distributed to the boundary road network using the distribution described in the June 2016 TIS Update, which was completed using Transportation Tomorrow Survey (TTS) data. Excerpts from the June 2016 TIS as well as the TTS data have been included in **Appendix G**.

The following residential trip distribution was established:

- 50% to and from the south on Highway 10 via the Highway 10 Access
- 5% to and from the north on Highway 10 via the Highway 10 Access

- 5% to and from the east on Main Street via the Highway 10 Access
- 15% travelling to and from the west on Main Street via Elm Street and Osprey Street
- 15% to and from the west on Main Street via Russell Street
- 5% to and from the east on Main Street via Russell Street
- 5% to and from the north on Highway 10 via Russell Street

Figure 10 outlines the residential trip distribution for the development. The associated primary trip assignment is illustrated in **Figure 13**.

5.2.2. Commercial Primary Trips

The primary trips generated by the commercial component of the proposed development were distributed to the boundary road network based on the expected catchment areas in the community. The main catchment area is expected to be comprised of the surrounding residential dwellings in the urban area of the Community of Dundalk.

Given the scale of the Edgewood Greens development, it is assumed that the commercial development will primarily service residents from within the development. As such, half the primary commercial trips were assumed to remain within Edgewood Greens. The remaining trips were distributed to the west on Main Street and Victoria Street via Russell Street and Elm Street, respectively.

Figure 11 outlines the residential trip distribution for the development. The associated primary trip assignment is illustrated in **Figure 14**.

5.2.3. Commercial Pass-By Trips

The pass-by trips generated by the proposed development are expected to utilize the proposed site access to Highway 10. Existing turning movement counts were used to establish the pass-by trip distribution. Pass-by trips are only considered in the p.m. peak hour, accordingly, only this timeframe was analyzed. In the weekday p.m. peak hour, 35 percent of trips were observed travelling south on Highway 10, with the remaining 65 percent travelling north on Highway 10.

Figure 12 outlines the pass-by trip distribution for the site, and **Figure 15** outlines the corresponding pass-by trip assignment.

5.3 Auxiliary Turn-Lane Assessment

Auxiliary left-turn lane warrants were undertaken for a northbound left-turn lane on Highway 10 at the proposed site access. The warrants were completed using the MTO Design Supplement for TAC Geometric Design Guide for Canadian Roads. Highway 10 has a posted speed limit of 80 km/h fronting the site access. Accordingly, a design speed of 100 km/h was selected, reflecting the engineering convention of a 20 km/h increase on higher speed roadways. **Table 9** summarizes the results of the northbound left-turn lane analyses.

Table 9: 2035 Future Total Auxiliary Lane Analysis

Intersection	Peak Hour	V _A	% Left Turns in V _A	V _O	Warranted	Minimum Storage	MTO GDSOH Figure
Highway 10 and Site Access	A.M.	272	20%	277	Yes	15 m	Ex 9A-23
	P.M.	687	27%	316	Yes	40 m	Ex 9A-24

It can be seen that the volumes on Highway 10 exceed the minimum threshold for an auxiliary left-turn lane in the weekday a.m. and p.m. peak hours. The morning volumes warrant a left-turn lane with a minimum storage length of 15 metres, while the evening volumes warrant a left-turn lane with a minimum storage length of 40 metres. The auxiliary left-turn lane warrant charts have been included in **Appendix H** for reference.

A southbound right-turn lane was considered on Highway 10 at the proposed site access. Per the Transportation Association of Canada (TAC) Geometric Design Guide for Canadian Roads (GDGCR), a right-turn lane is required when the volume of right-turns causes a large delay to the through movements. The projected volume of right-turning vehicles at the site accesses is forecasted to be a maximum of 40 vehicles (p.m.), which represents approximately 13 percent of southbound volumes. This volume of right-turning vehicles is not expected to cause a delay to the southbound through traffic on Highway 10, which is evidenced by the future total results described in the subsequent section. Accordingly, an auxiliary right-turn lane or taper is not warranted for reasons of delay.

5.4 Intersection Operations

The site generated traffic volumes illustrated in **Figures 13, 14 and 15** were added to the 2025, 2030 and 2035 future background traffic volumes in **Figures 7, 8 and 9**, respectively, to determine the future total traffic volumes. **Figures 16, 17 and 18** outline the 2025, 2030 and 2035 future total traffic volumes, respectively. **Table 10, Table 11 and Table 12** outline the 2025, 2030 and 2035 future total traffic operations, respectively. Detailed capacity analysis worksheets are included in **Appendix C**.

Table 10: 2025 Future Total Levels of Service

Intersection	Control	Peak Hour	Level of Service ¹	Control Delay	Maximum v/c ratio ²	95 th Percentile Queues > Storage
Highway 10 and Main Street	Signal	A.M.	B	11.3 s	0.45 (EBT)	None
		P.M.	B	12.4 s	0.49 (EBT)	None
Main Street and Russell Street	Two-way Stop	A.M.	B	11.7 s	0.20 (NB)	None
		P.M.	B	13.0 s	0.17 (NB)	None
Main Street and Alice Street/Mill Street	Two-way Stop	A.M.	B	11.2 s	0.05 (NB)	None
		P.M.	B	14.7 s	0.06 (NB)	None
Main Street and Osprey Street	Two-way Stop	A.M.	B	14.1 s	0.14 (NB)	None
		P.M.	C	15.5 s	0.13 (NB)	None
Elm Street and Victoria Street	Two-way Stop	A.M.	A	9.8 s	0.15 (NB)	None
		P.M.	A	9.9 s	0.10 (NB)	None
Highway 10 and Site Access	Two-way Stop	A.M.	B	12.6 s	0.32 (EB)	None
		P.M.	C	17.0 s	0.34 (EB)	None

Note¹: The Level of Service of a signalized intersection is based on the average control delay per vehicle (Synchro/ICU).
The Level of Service of a two-way stop-controlled intersection is based on the delay associated with the critical minor road approach (HCM 2000).

Note²: The maximum v/c ratio for two-way stop-controlled intersections represents the maximum v/c for the minor road approach movements at the intersection. Any movements that experience a v/c ratio in excess of 0.85 are considered critical per the MTO TIS Guidelines.

Table 11: 2030 Future Total Levels of Service

Intersection	Control	Peak Hour	Level of Service ¹	Control Delay	Maximum v/c ratio ²	95 th Percentile Queues > Storage
Highway 10 and Main Street	Signal	A.M.	B	11.5 s	0.46 (EBT)	None
		P.M.	B	12.9 s	0.51 (EBT)	None
Main Street and Russell Street	Two-way Stop	A.M.	B	12.0 s	0.21 (NB)	None

Main Street and Alice Street/Mill Street	Two-way Stop	A.M.	B	11.7 s	0.06 (NB)	None
		P.M.	C	16.9 s	0.08 (NB)	None
Main Street and Osprey Street	Two-way Stop	A.M.	C	15.2 s	0.16 (NB)	None
		P.M.	C	16.9 s	0.15 (NB)	None
Elm Street and Victoria Street	Two-way Stop	A.M.	A	9.9 s	0.16 (NB)	None
		P.M.	B	10.1 s	0.11 (NB)	None
Highway 10 and Site Access	Two-way Stop	A.M.	B	13.2 s	0.34 (EB)	None
		P.M.	C	19.1 s	0.37 (EB)	None

Note¹: The Level of Service of a signalized intersection is based on the average control delay per vehicle (Synchro/ICU).
The Level of Service of a two-way stop-controlled intersection is based on the delay associated with the critical minor road approach (HCM 2000).

Note²: The maximum v/c ratio for two-way stop-controlled intersections represents the maximum v/c for the minor road approach movements at the intersection. Any movements that experience a v/c ratio in excess of 0.85 are considered critical per the MTO TIS Guidelines.

The intersections of Highway 10 and Main Street, Main Street and Russell Street, and Elm Street and Victoria Street are expected to continue operating with a LOS "B" or better under 2035 future total traffic volume conditions in the weekday a.m. and p.m. peak hours. The intersections of Main Street and Alice Street/Mill Street, Main Street and Osprey Street, and Highway 10 and the proposed site access are expected to operate at a LOS "C" or better under 2035 future total traffic volume conditions in the weekday a.m. and p.m. peak hours.

Across all intersections, the maximum increase in control delay is forecasted to be 3.4 seconds in the a.m. peak hour at the intersection of Main Street and Osprey Street, when compared to the 2035 future background operations. Similarly, the maximum increase in volume-to-capacity ratio across all intersections is forecasted to be 0.16 in the a.m. peak hour at the intersection of Main Street and Russell Street. The 95th percentile queue length for northbound left-turns at the proposed Highway 10 access is anticipated to be approximately 14 metres. This can be contained within the proposed 40-metre storage length.

All of the study intersections are expected to continue operating with good levels of service under 2035 future total traffic volume conditions, and all 95th percentile queues can be contained within their available storage lengths. The additional traffic generated by the proposed development is expected to have a minimal impact on the operations of the boundary road network. Accordingly, the proposed development can be supported from an operations perspective.

6.0 Sight Distance Analysis

A sight distance analysis was conducted to confirm that there is sufficient sight distance for drivers approaching and exiting the site at the proposed site access. The measured sight distances were compared to the standards set out in the Transportation Association of Canada (TAC) Geometric Design Guild for Canadian Roads (GDGCR).

6.1 Stopping Sight Distance

Highway 10 has a posted speed limit of 80 km/h. Accordingly, a design speed of 100 km/h was selected, reflecting the convention of a 20 km/h increase to the posted speed limit for higher speed roads. Highway 10 is straight and relatively flat adjacent to the site.

Per TAC GDGCR Table 2.5.2, the minimum stopping sight distance for level roadways with a design speed of 100 km/h is 185 metres. Clear visibility in excess of 500 metres is available to the north and south of the proposed site access. Accordingly, there is sufficient stopping sight distance for vehicles approaching from the north and south of the site access.

Relevant TAC GDGCR excerpts are included in **Appendix I**.

6.2 Intersection Sight Distance

Section 9.9 of the TAC GDGCR provides intersection sight distance for different intersection control types. The applicable cases are as follows:

- Case B – Intersections with stop control on the minor road
 - Case B1 – Left turn from the minor road (Site Access)
 - Case B2 – Right turn from the minor road (Site Access)
- Case F – Left turns from the major road (Highway 10)

Intersection sight distance is calculated using equation 9.9.1 from the GDGCR as outlined below:

$$ISD = 0.278 * V_{\text{major}} * t_G$$

Where;

ISD = Intersection Sight Distance

V_{major} = design speed of roadway (km/h)

t_G = assumed time gap for vehicles to turn from stop onto roadway (s)

The calculated and design sight distances are further summarized in TAC GDGCR Tables 9.9.4, 9.9.6 and 9.9.12 for vehicles turning left from stop, turning right from stop, or turning left from the major road, respectively.

Case B1 (vehicles turning left from stop) results in the greatest required sight distance. As such, only the requirements of Case B1 are summarized below. The time gap was obtained from Table 9.9.3 in the GDGCR. Relevant excerpts from TAC GDGCR are included in **Appendix I. Table 13** contains a summary of the intersection sight distance requirements for Case B1.

Table 13: Intersection Sight Distance

Case	Time Gap	Required Intersection Sight Distance	Available Sight Distance	TAC Reference
Highway 10 Design Speed = 100 km/h				
B1: Vehicles turning left from stop	7.5 s	210 m	+500 m (north and south)	Table 9.9.4

The available sight distance on Highway 10 to the north and south of the site access exceeds the minimum sight distance requirements. Accordingly, the proposed access can be supported from a sight distance perspective.

7.0 Conclusions

The analysis contained within this report has resulted in the following key findings:

- All study intersections are currently operating with a LOS "B" or better in the weekday a.m. and p.m. hours.
- Examination of the future background conditions indicates the following:
 - All intersections are expected to continue operating with a LOS of "B" or greater under the future background conditions for both a.m. and p.m. peaks, with the exception of Main street and Mill Street/ Alice Street which operates at a LOS "C" during the p.m. peak hour.
 - 95th percentile queues are not expected to exceed available storage lengths.
- The development is forecasted to generate 460 and 618 two-way primary trips in the weekday a.m. and p.m. peak hours, respectively. The development is forecasted to generate 0 and 23 pass-by trips in the a.m. and p.m. peak hours, respectively. The trips were distributed to the boundary road network based on TTS data as well as the location of the expected catchment areas for the commercial component of the development.

- The addition of site traffic to the boundary road network is expected to result in minor impacts to traffic operations. The analysis of future total traffic conditions indicates the following:
 - An auxiliary northbound left-turn lane with a minimum storage length of 40 metres is warranted at the proposed Highway 10 site access. The intersection is expected to operate with LOS "B" in the a.m. and LOS "C" in the p.m. peak hours.
 - The intersections of Highway 10 and Main Street, and Main Street and Russell Street are expected to continue operating with a LOS "B" in all time periods.
 - The intersections of Main Street and Osprey Street is expected to operate with a LOS "C" in the a.m. and p.m. peak hours.
 - The intersection of Elm Street and Victoria Street is expected to continue operating with a LOS "B" in the a.m. and LOS "A" in the p.m. peak hours.
 - The intersection of Main Street and Mill Street/Alice Street is expected to continue to operate at a LOS "B" in the a.m. and LOS "C" in the p.m. peak hours.
 - The addition of the site generated traffic is expected to result in a maximum control delay increase of 3.4 seconds (a.m. – Osprey Street) and a maximum volume-to-capacity ratio increase of 0.16 (NB, a.m. – Russell Street).
- The available stopping and intersection sight distances on Highway 10 to the north and south of the site access exceed the minimum requirements outlined in the TAC GDGCR and can therefore support the additional vehicular traffic.

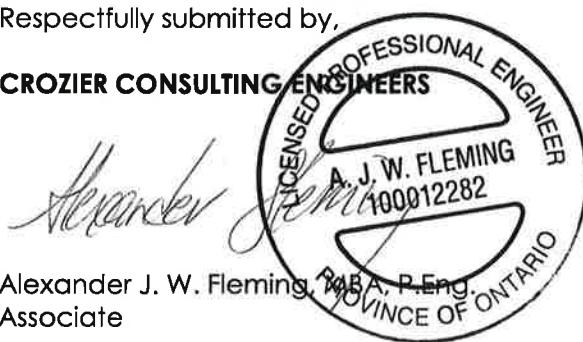

It is concluded that the traffic generated by the proposed development can be accommodated by the boundary road network, with the noted recommendation.

The analysis undertaken herein was prepared using the most recent Draft Plans and Concept Plan. Any minor changes to the Plan will not materially affect the conclusions contained within this report.

The proposed mixed-use residential/commercial development can be supported from a traffic operations and safety perspective.

APPENDIX B

Level of Service Definitions

Level of Service Definitions

Two-Way Stop Controlled Intersections

Level of Service	Control Delay per Vehicle (seconds)	Interpretation
A	≤ 10	EXCELLENT. Large and frequent gaps in traffic on the main roadway. Queuing on the minor street is rare.
B	$> 10 \text{ and } \leq 15$	VERY GOOD. Many gaps exist in traffic on the main roadway. Queuing on the minor street is minimal.
C	$> 15 \text{ and } \leq 25$	GOOD. Fewer gaps exist in traffic on the main roadway. Delay on minor approach becomes more noticeable.
D	$> 25 \text{ and } \leq 35$	FAIR. Infrequent and shorter gaps in traffic on the main roadway. Queue lengths develop on the minor street.
E	$> 35 \text{ and } \leq 50$	POOR. Very infrequent gaps in traffic on the main roadway. Queue lengths become noticeable.
F	> 50	UNSATISFACTORY. Very few gaps in traffic on the main roadway. Excessive delay with significant queue lengths on the minor street.

Adapted from Highway Capacity Manual 2000, Transportation Research Board

Level of Service Definitions

Signalized Intersections

Level of Service	Control Delay per Vehicle (seconds)	Interpretation
A	≤ 10	EXCELLENT. Extremely favourable progression with most vehicles arriving during the green phase. Most vehicles do not stop and short cycle lengths may contribute to low delay.
B	$> 10 \text{ and } \leq 20$	VERY GOOD. Very good progression and/or short cycle lengths with slightly more vehicles stopping than LOS "A" causing slightly higher levels of average delay.
C	$> 20 \text{ and } \leq 35$	GOOD. Fair progression and longer cycle lengths lead to a greater number of vehicles stopping than LOS "B".
D	$> 35 \text{ and } \leq 55$	FAIR. Congestion becomes noticeable with higher average delays resulting from a combination of long cycle lengths, high volume-to-capacity ratios and unfavourable progression.
E	$> 55 \text{ and } \leq 80$	POOR. Lengthy delays values are indicative of poor progression, long cycle lengths and high volume-to-capacity ratios. Individual cycle failures are common with individual movement failures also common.
F	> 80	UNSATISFACTORY. Indicative of oversaturated conditions with vehicular demand greater than the capacity of the intersection.

Traffic Office (905)-704-2960

Abstract:
This annual publication contains averaged traffic volume information and accident rate information for each of the sections of highway under MTO jurisdiction.

Key Words:
Annual Average Daily Traffic volume (AADT), Summer Average Daily Traffic volume (SADT), Summer Average Weekday Traffic volume (SAWDT), Winter Average Daily Traffic volume (WADT), Accident Rate (AR)

PREFACE

Traffic volume information is used by many people to assist them in assessing the viability of business proposals, land use options, marketing, advertising, and a host of other activities. This publication, **Provincial Highways Traffic Volumes 1988-2016**, provides traffic volumes on an annual and seasonal average basis for selected links in the provincial highway network. The traffic pattern type and accident rates on the selected links are also indicated.

Some highway routes which have not yet been assigned an official highway number, are included under the title Selected 7000 Series Highways. **The Highway 407 ETR is maintained by 407 ETR Concession Company Ltd. and is not included in this publication. For information contact the 407 ETR Traffic**

Department at (905) 265-4070. Site or time specific information not contained herein may be obtained from the Ministry of Transportation's Regional Traffic Sections, located in London, Toronto, Kingston, North Bay and Thunder Bay. Contact MTO INFO at 1-800-268-4686 for the appropriate regional phone number.

The statistics contained herein have been prepared based on data (both electronic and otherwise) obtained from sources considered to be reliable. The Ministry makes no representation or warranty, expressed or implied with respect to its accuracy or completeness. This publication also supersedes any previously published publications.

Crozier & Associates Inc. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

2 INTRODUCTION

2.1 Background

CF Crozier & Associates Inc. (Crozier) was retained by 2358737 Ontario Inc. ("the Developer") to complete a Traffic Impact Study (TIS) to support a Zoning By-law Amendment, Official Plan Amendment and Draft Plan Application for a proposed residential development located in the west end of the Community of Dundalk, Township of Southgate, County of Grey.

2.2 Purpose

This TIS is being prepared to support the Zoning By-law Amendment, Official Plan Amendment and Draft Plan Application for the proposed residential development (referred to as "Glenelg") in the Community of Dundalk.

The purpose of the study was to assess the impacts of the proposed development on the boundary road network and to recommend any mitigation measures, if warranted.

The study reviews the following main aspects of the proposed residential development from a transportation engineering perspective:

- Existing, future background, and future total traffic operations at the study intersections
- Forecasted trip generation of the proposed development
- Auxiliary lane requirements at the proposed site accesses
- Sight distance requirements at the proposed site accesses

The Terms of Reference for the study were confirmed with staff from Triton Engineering, who are the engineering reviewers for the Township of Southgate, with correspondence included in **Appendix A**.

2.3 Development Proposal

The site statistics proposed on the Draft Plan have been summarized in **Table 1** below. Access to the site will be provided by two accesses to Glenelg Street, spaced approximately 220 metres apart. The two internal roads connecting to Glenelg Street are described as Street "A" and Street "B" on the Draft Plan. Street "B" is located approximately 130 metres west of the intersection of Dundalk Street and Glenelg Street/Grey Street.

The development also proposes an internal walkway and pedestrian connection to the open space, park space and the existing Grey County CP Rail Trail.

It has been assumed that for the purposes of this analysis, the entire development will be built in one phase.

Table 1: Development Site Statistics

Development Type	Unit Type	Conceptual Site Plan (October 25, 2017)
Residential	Single Family Detached	127
	Townhomes	26

The Draft Plan prepared by MHBC Planning (September 24, 2018) has been included as **Figure 1**.

"B" or better under 2028 future background conditions, with minimal delays and reserve capacity for increases in traffic volumes.

5 SITE GENERATED TRAFFIC

The proposed development will result in additional vehicles on the boundary road network that previously did not exist. The proposed development will also result in additional turning movements at the boundary road intersections.

5.1 Trip Generation

The trip generation of the single detached residential lots was forecasted using the fitted curve equations provided in the ITE Trip Generation Manual, 10th Edition, under the Land Use Category 210 "Single Family Detached Dwelling".

The trip generation of the townhouse residential lots was forecasted using the fitted curve equations provided in the ITE Trip Generation Manual, 10th Edition, under the Land Use Category 220 "Multifamily Housing (Low-Rise)".

The trip generation of Glenelg is summarized in **Table 8**. Relevant excerpts from the ITE Trip Generation Manual, 10th Edition are included in **Appendix I**.

Table 8: Glenelg Trip Generation

Use	Trip Type	Peak Hour	Number of Trips		
			Inbound	Outbound	Total
L.U. 210: Single Family Detached Housing (Glenelg: 127 Units)	Primary	Weekday A.M.	23	71	94
	Primary	Weekday P.M.	81	47	128
L.U. 220: Multifamily Housing (Low-Rise) (Glenelg: 26 Units)	Primary	Weekday A.M.	3	10	13
	Primary	Weekday P.M.	11	7	18
Total	Primary	Weekday A.M.	26	81	107
	Primary	Weekday P.M.	92	54	146

5.2 Trip Distribution and Assignment

The trip distribution utilized in the Flato North and East development was used as a basis for the Glenelg development. This distribution was compared with recent Transportation Tomorrow Survey (TTS) data for the Township of Melancthon. The TTS is a comprehensive survey of transportation characteristics in the Golden Horseshoe, Simcoe County and Grey County areas. In order to obtain survey data most applicable to the Subject Property, TTS data was filtered for the Township of Melancthon. TTS data is not available for the Community of Dundalk, accordingly, the Township of Melancthon (abutting the Dundalk to the south and east) was selected as it is considered most representative of the subject area.

The TTS data was found to be consistent with the distribution utilized in the Flato East and Flato North TIS, and thus was used for this analysis. TTS Data has been included in **Appendix J**. The trip distribution is as follows:

- 10 % to/from the north on Ida Street
- 10% to/from the west on Ida Street
- 10% to/from the east on Grey Road 9
- 50% to/from the south on Highway 10
- 20% to/from Dundalk (downtown)

Of the 20 percent remaining in Dundalk, five percent were assumed to travel south on Dundalk Street and then turn right to travel west on Main Street West. The remaining 15 percent were assumed to travel east on Grey Street South and use Proton Street North to access the main downtown commercial corridor.

The development was analyzed under a consolidated access configuration to obtain a conservative analysis. The future operations of the site accesses to Glenelg Street are expected to be better than listed herein as traffic volumes will be diffused across both accesses.

The trips generated by the proposed development were assigned to the boundary road network per the distributions illustrated in **Figure 9**. The corresponding trip assignment is illustrated in **Figure 10**.

6 TOTAL FUTURE CONDITIONS

6.1 Basis of Assessment

The traffic impacts arising from the proposed development were assessed on the basis of the site generated traffic, illustrated in **Figure 10** being superimposed on the future background traffic volumes in **Figures 7 and 8**. The resulting total traffic volumes for the weekday a.m. and p.m. peak hours are illustrated in **Figures 11 and 12** for the 2023 through 2028 horizon years.

6.2 Auxiliary Lane Assessment

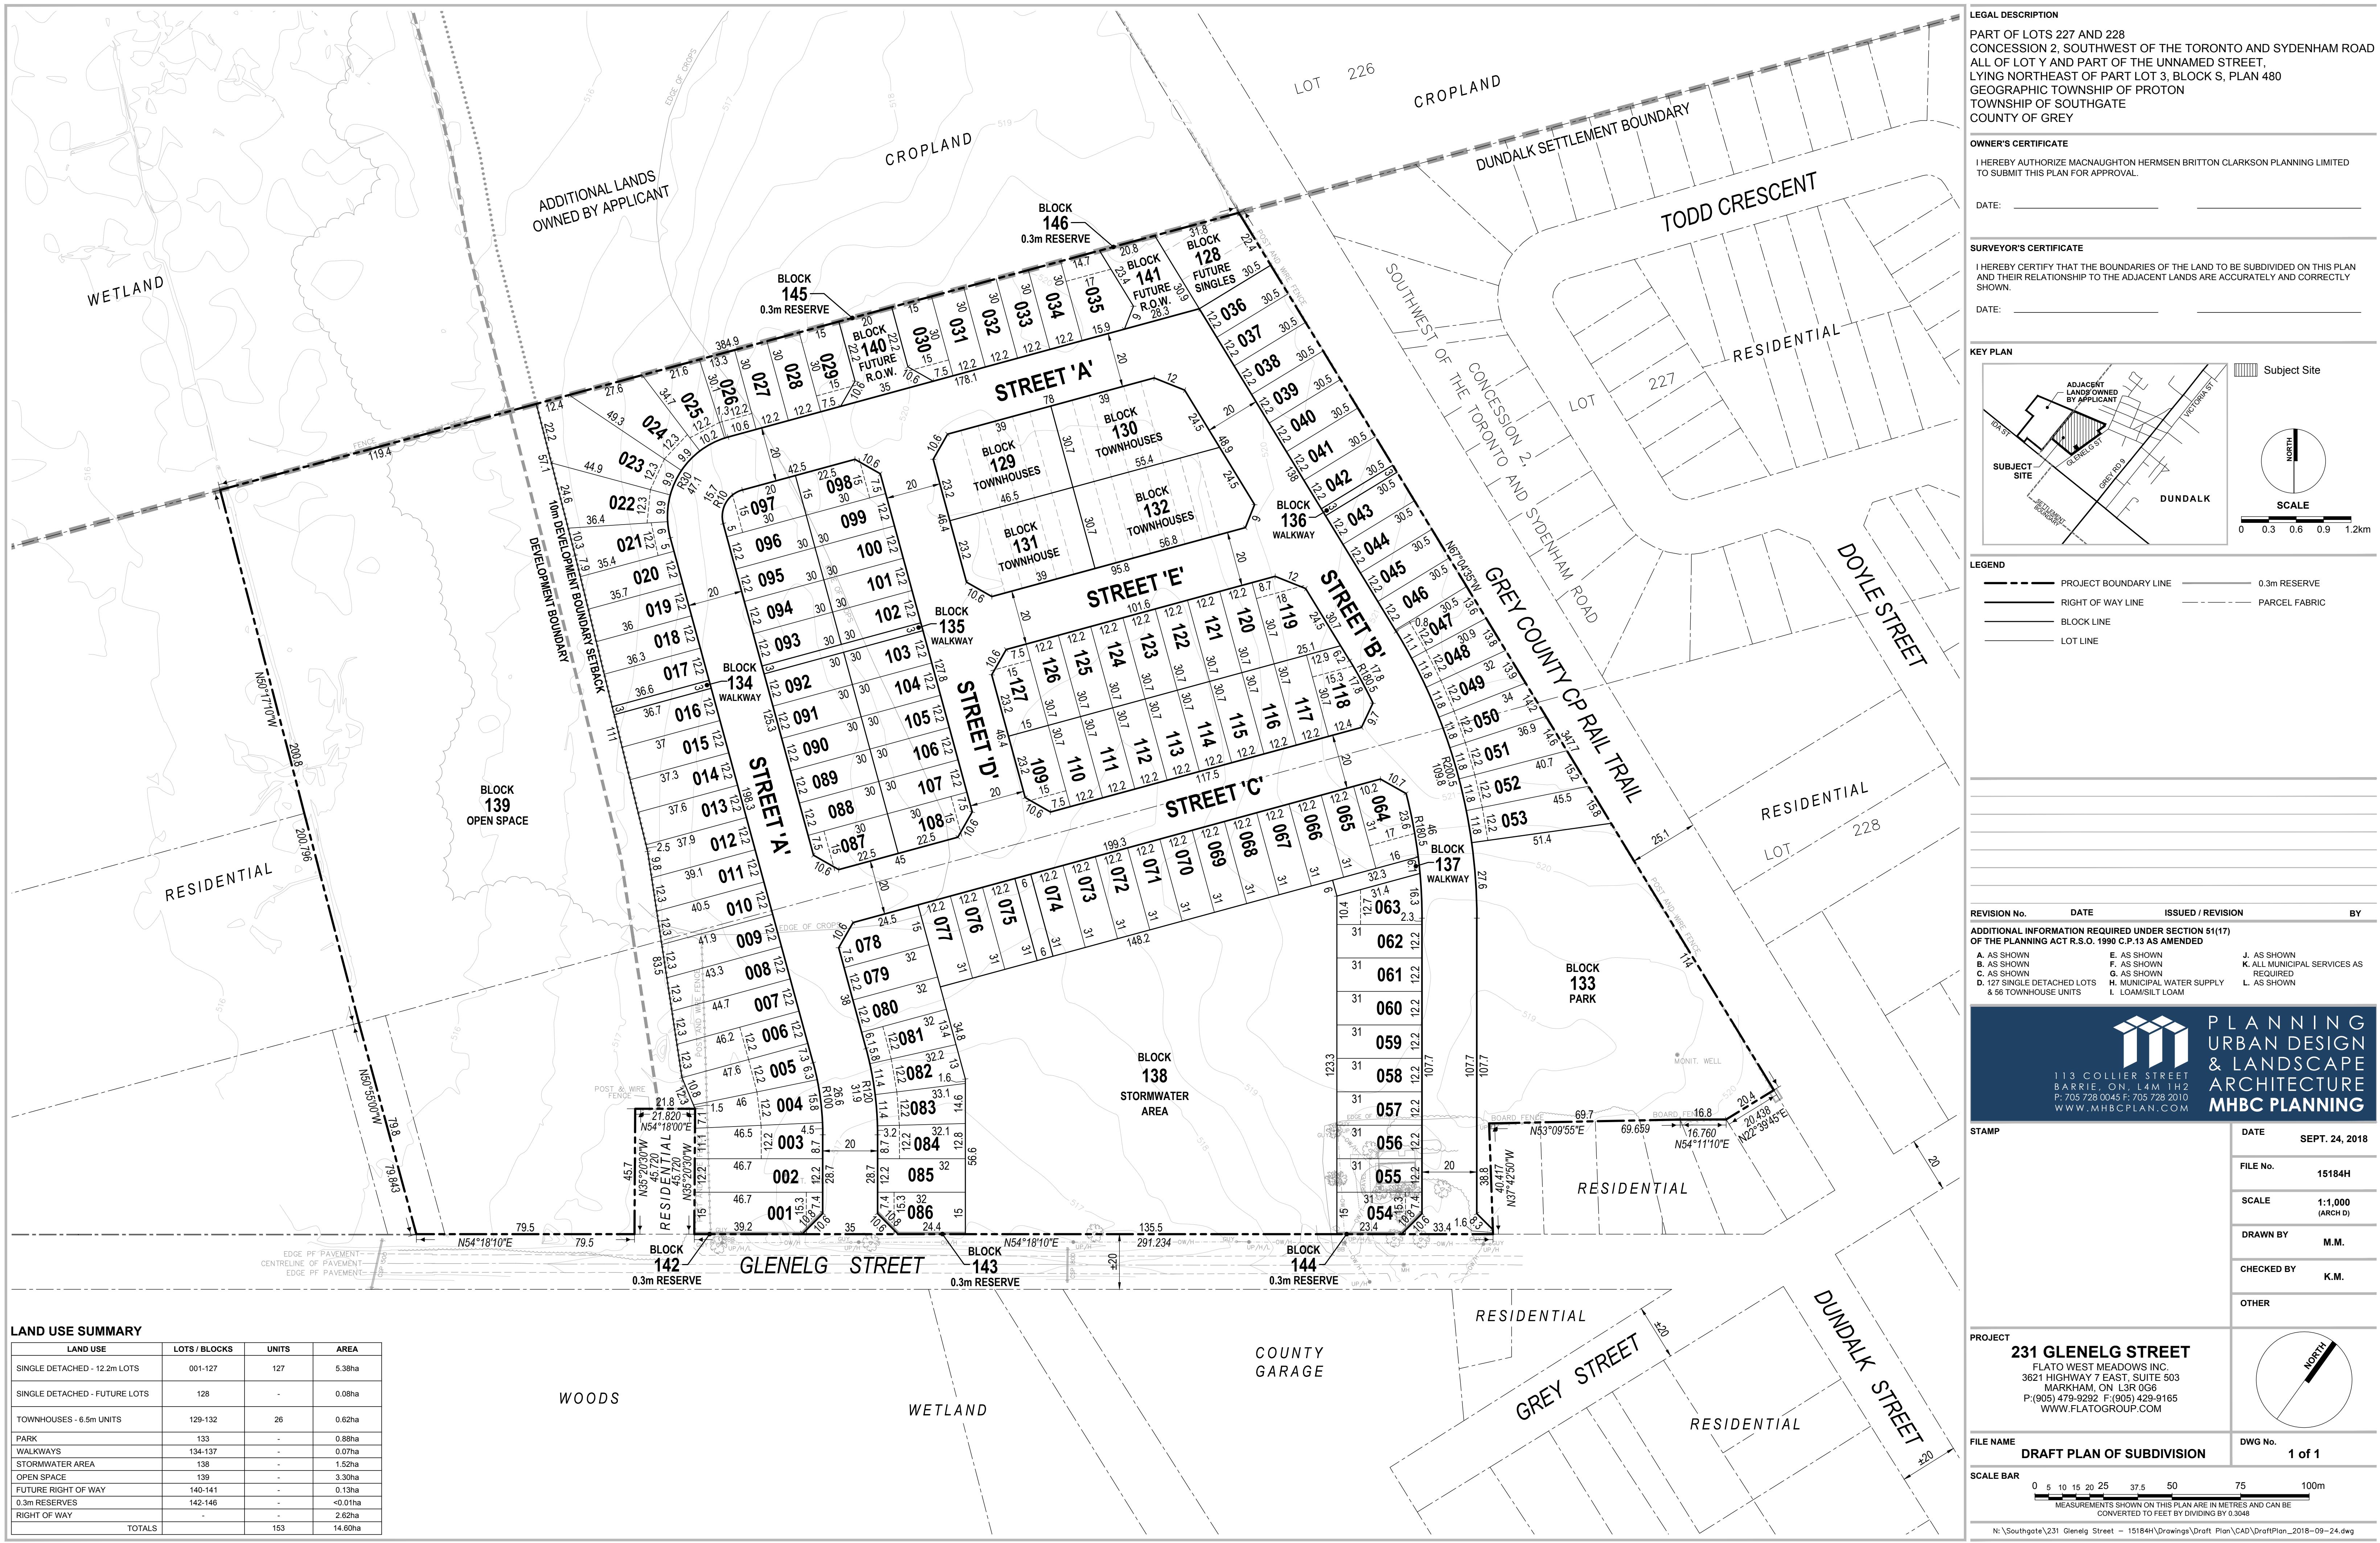

Traffic volumes at the intersections of Ida Street and Glenelg Street, Glenelg Street and the Site Access, and Dundalk Street and Main Street West do not meet the threshold to warrant auxiliary left-turn lanes. Accordingly, the future total traffic volumes were analyzed under existing lane configurations. The intersection of Glenelg Street and the Site Access was analyzed with shared through/turn lanes on all approaches.

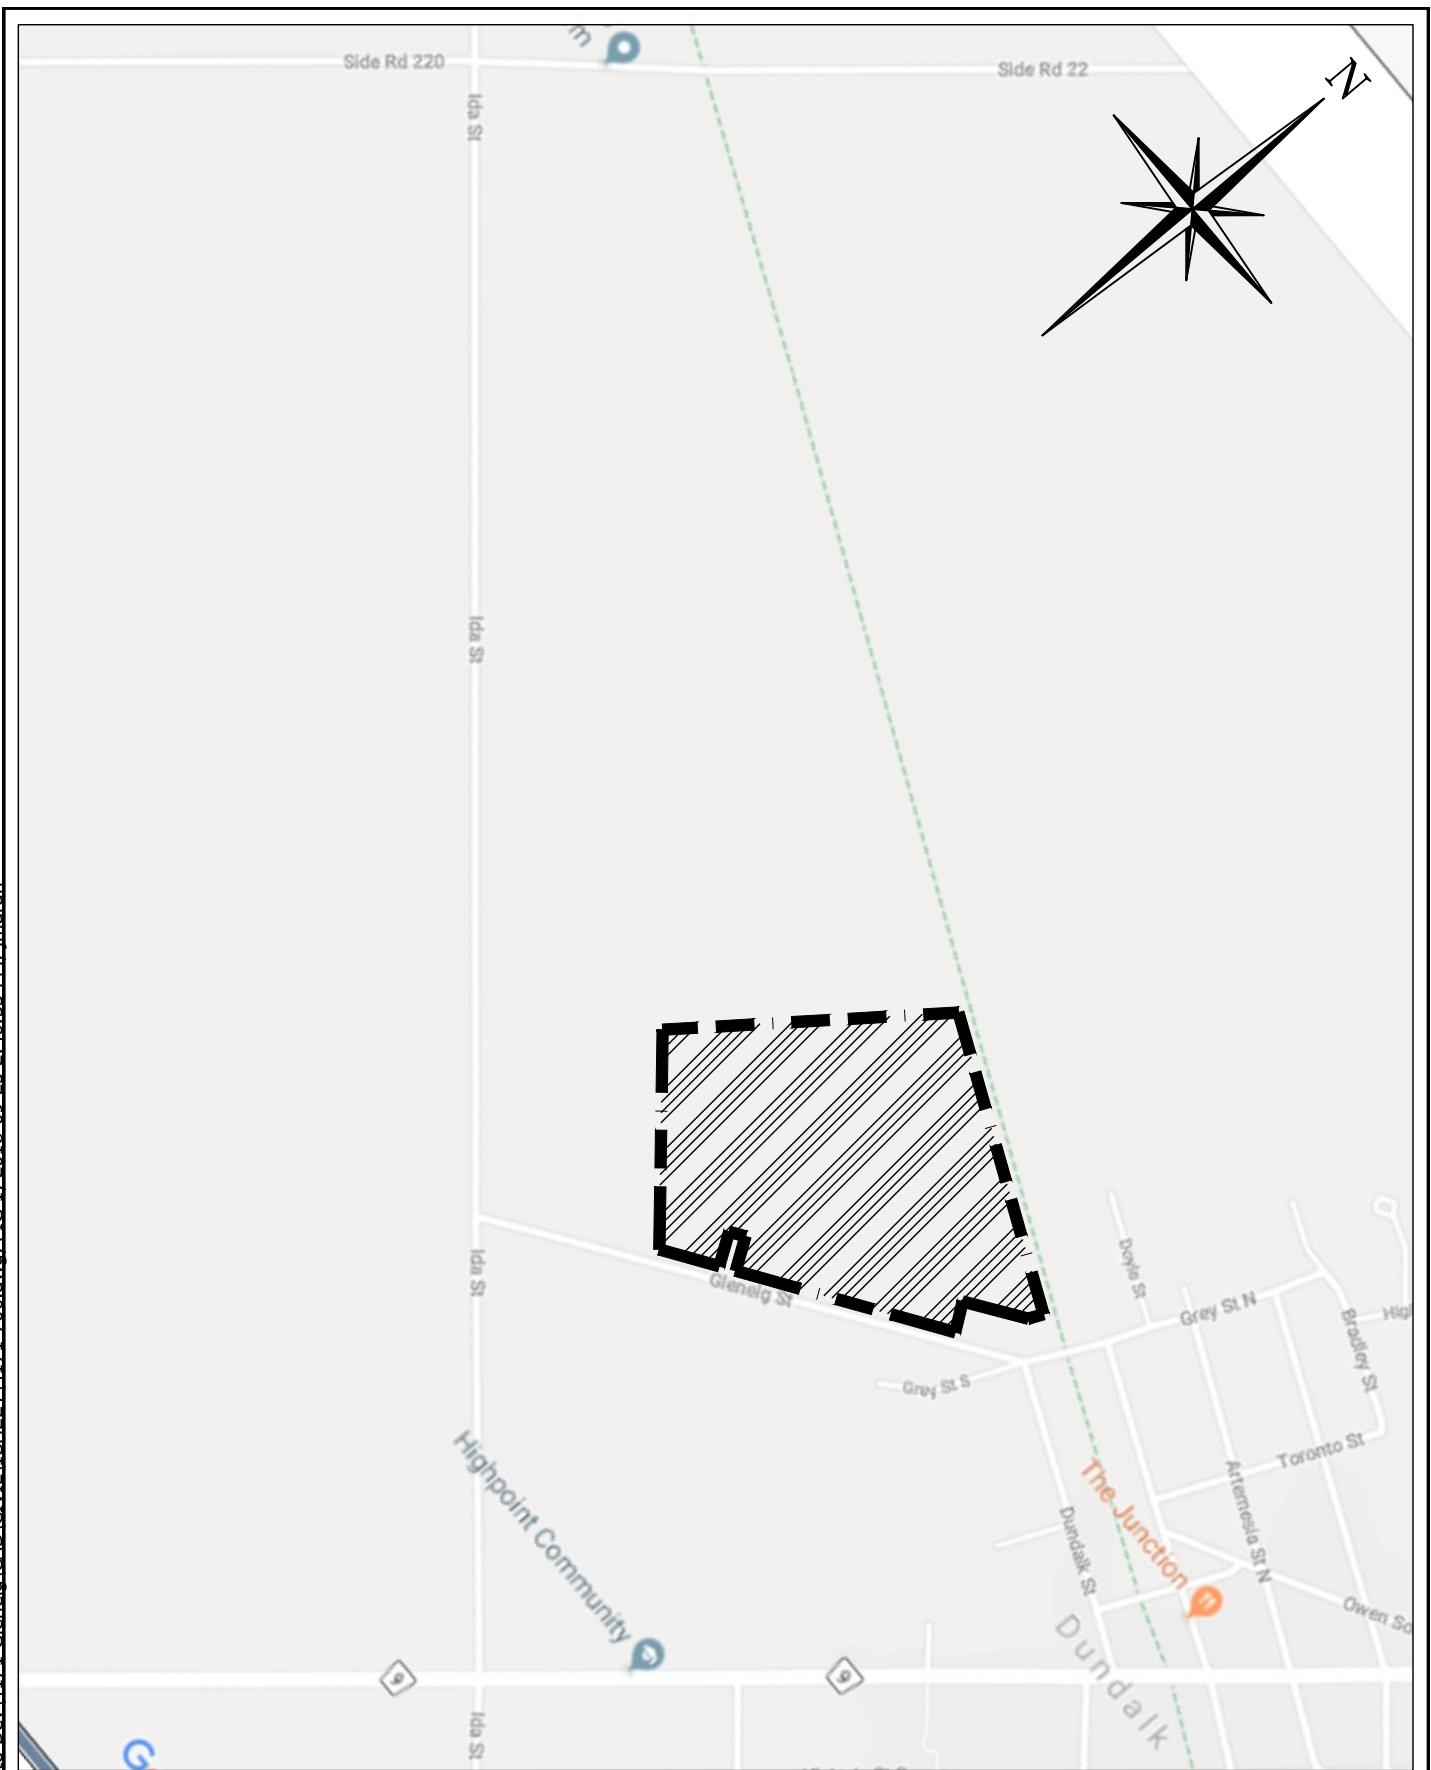

The left-turn lane warrant charts for 60 km/h design speed roads have been included in **Appendix K** for reference.

The requirement for a westbound right-turn lane at the site entrance was also analyzed. According to the TAC GDGCR, a right-turn lane is required when the volume of vehicles compared with the through traffic volume causes undue hazard. In the 2028 horizon year, 20 and 74 vehicles are forecasted to make a westbound right-turn at the site entrance. This can be compared with the westbound through volumes of 12 and 29 in the a.m. and p.m. peak hours, respectively. Considering these volumes in combination with the traffic modelling results, it is demonstrated that a right-turn lane is not required to facilitate right turns at the site entrance. The intersection is anticipated to operate at an excellent level of service, and the through movements are not expected to be impeded.

6.3 Intersection Operations

The 2023 through 2028 future total traffic operations of the boundary road network are summarized in **Table 9 and Table 10**. The detailed capacity analysis is included in **Appendix F**, and LOS definitions are included in **Appendix E**.

APPENDIX F

ITE Trip Generation Excerpts

Trip Generation Manual

10th Edition • Volume 2: Data
Residential (Land Uses 200–299)

SEPTEMBER 2017

INSTITUTE OF TRANSPORTATION ENGINEERS

Land Use: 210

Single-Family Detached Housing

Description

Single-family detached housing includes all single-family detached homes on individual lots. A typical site surveyed is a suburban subdivision.

Additional Data

The number of vehicles and residents had a high correlation with average weekday vehicle trip ends. The use of these variables was limited, however, because the number of vehicles and residents was often difficult to obtain or predict. The number of dwelling units was generally used as the independent variable of choice because it was usually readily available, easy to project, and had a high correlation with average weekday vehicle trip ends.

This land use included data from a wide variety of units with different sizes, price ranges, locations, and ages. Consequently, there was a wide variation in trips generated within this category. Other factors, such as geographic location and type of adjacent and nearby development, may also have had an effect on the site trip generation.

Single-family detached units had the highest trip generation rate per dwelling unit of all residential uses because they were the largest units in size and had more residents and more vehicles per unit than other residential land uses; they were generally located farther away from shopping centers, employment areas, and other trip attractors than other residential land uses; and they generally had fewer alternative modes of transportation available because they were typically not as concentrated as other residential land uses.

Time-of-day distribution data for this land use are presented in Appendix A. For the six general urban/suburban sites with data, the overall highest vehicle volumes during the AM and PM on a weekday were counted between 7:15 and 8:15 a.m. and 4:00 and 5:00 p.m., respectively. For the two sites with Saturday data, the overall highest vehicle volume was counted between 3:00 and 4:00 p.m. For the one site with Sunday data, the overall highest vehicle volume was counted between 10:15 and 11:15 a.m.

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in California, Connecticut, Delaware, Illinois, Indiana, Maryland, Minnesota, Montana, New Jersey, North Carolina, Ohio, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Vermont, and Virginia.

Land Use: 220

Multifamily Housing (Low-Rise)

Description

Low-rise multifamily housing includes apartments, townhouses, and condominiums located within the same building with at least three other dwelling units and that have one or two levels (floors). Multifamily housing (mid-rise) (Land Use 221), multifamily housing (high-rise) (Land Use 222), and off-campus student apartment (Land Use 225) are related land uses.

Additional Data

In prior editions of *Trip Generation Manual*, the low-rise multifamily housing sites were further divided into rental and condominium categories. An investigation of vehicle trip data found no clear differences in trip making patterns between the rental and condominium sites within the ITE database. As more data are compiled for future editions, this land use classification can be reinvestigated.

For the three sites for which both the number of residents and the number of occupied dwelling units were available, there were an average of 2.72 residents per occupied dwelling unit.

For the two sites for which the numbers of both total dwelling units and occupied dwelling units were available, an average of 96.2 percent of the total dwelling units were occupied.

This land use included data from a wide variety of units with different sizes, price ranges, locations, and ages. Consequently, there was a wide variation in trips generated within this category. Other factors, such as geographic location and type of adjacent and nearby development, may also have had an effect on the site trip generation.

Time-of-day distribution data for this land use are presented in Appendix A. For the 10 general urban/suburban sites with data, the overall highest vehicle volumes during the AM and PM on a weekday were counted between 7:15 and 8:15 a.m. and 4:45 and 5:45 p.m., respectively. For the one site with Saturday data, the overall highest vehicle volume was counted between 9:45 and 10:45 a.m. For the one site with Sunday data, the overall highest vehicle volume was counted between 11:45 a.m. and 12:45 p.m.

For the one dense multi-use urban site with 24-hour count data, the overall highest vehicle volumes during the AM and PM on a weekday were counted between 7:00 and 8:00 a.m. and 6:15 and 7:15 p.m., respectively.

For the three sites for which data were provided for both occupied dwelling units and residents, there was an average of 2.72 residents per occupied dwelling unit.

The average numbers of person trips per vehicle trip at the five general urban/suburban sites at which both person trip and vehicle trip data were collected were as follows:

- 1.13 during Weekday, Peak Hour of Adjacent Street Traffic, one hour between 7 and 9 a.m.
- 1.21 during Weekday, Peak Hour of Adjacent Street Traffic, one hour between 4 and 6 p.m.

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in British Columbia (CAN), California, District of Columbia, Florida, Georgia, Illinois, Indiana, Maine, Maryland, Minnesota, New Jersey, New York, Ontario, Oregon, Pennsylvania, South Dakota, Tennessee, Texas, Utah, Virginia, and Washington.

It is expected that the number of bedrooms and number of residents are likely correlated to the number of trips generated by a residential site. Many of the studies included in this land use did not indicate the total number of bedrooms. To assist in the future analysis of this land use, it is important that this information be collected and included in trip generation data submissions.

Trip Generation Manual

10th Edition • Volume 2: Data
Retail (Land Uses 800–899)

SEPTEMBER 2017

INSTITUTE OF TRANSPORTATION ENGINEERS

Land Use: 820 Shopping Center

Description

A shopping center is an integrated group of commercial establishments that is planned, developed, owned, and managed as a unit. A shopping center's composition is related to its market area in terms of size, location, and type of store. A shopping center also provides on-site parking facilities sufficient to serve its own parking demands. Factory outlet center (Land Use 823) is a related use.

Additional Data

Shopping centers, including neighborhood centers, community centers, regional centers, and super regional centers, were surveyed for this land use. Some of these centers contained non-merchandising facilities, such as office buildings, movie theaters, restaurants, post offices, banks, health clubs, and recreational facilities (for example, ice skating rinks or indoor miniature golf courses).

Many shopping centers, in addition to the integrated unit of shops in one building or enclosed around a mall, include outparcels (peripheral buildings or pads located on the perimeter of the center adjacent to the streets and major access points). These buildings are typically drive-in banks, retail stores, restaurants, or small offices. Although the data herein do not indicate which of the centers studied included peripheral buildings, it can be assumed that some of the data show their effect.

The vehicle trips generated at a shopping center are based upon the total GLA of the center. In cases of smaller centers without an enclosed mall or peripheral buildings, the GLA could be the same as the gross floor area of the building.

Time-of-day distribution data for this land use are presented in Appendix A. For the 10 general urban/suburban sites with data, the overall highest vehicle volumes during the AM and PM on a weekday were counted between 11:45 a.m. and 12:45 p.m. and 12:15 and 1:15 p.m., respectively.

The average numbers of person trips per vehicle trip at the 27 general urban/suburban sites at which both person trip and vehicle trip data were collected were as follows:

- 1.31 during Weekday, AM Peak Hour of Generator
- 1.43 during Weekday, Peak Hour of Adjacent Street Traffic, one hour between 4 and 6 p.m.
- 1.46 during Weekday, PM Peak Hour of Generator

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in Alberta (CAN), British Columbia (CAN), California, Colorado, Connecticut, Delaware, District of Columbia, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland, Massachusetts, Michigan, Minnesota, Nevada, New Jersey, New York, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Tennessee, Texas, Vermont, Virginia, Washington, West Virginia, and Wisconsin.

TRAFFIC IMPACT STUDY

**DUNDALK MEADOWS
TOWNSHIP OF SOUTHGATE**

FLATO DUNDALK MEADOWS INC.

PREPARED BY:

**C.F. CROZIER & ASSOCIATES INC.
40 HURON STREET
COLLINGWOOD, ONTARIO
L9Y 4R3**

ORIGINAL – DECEMBER 2015

ADDENDUM – FEBRUARY 2016

ADDENDUM – JUNE 2016

CFCA FILE NO. 1060-4066

The material in this report reflects best judgment in light of the information available at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions made based on it, are the responsibilities of such third parties. C.F. Crozier & Associates Inc. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

capacity ratio is 0.00.

The intersection of Main Street and Osprey Street is operating at LOS "B" under existing traffic conditions. This intersection is operating well and will experience a control delay of 11.6 seconds or less and volume-to-capacity ratio of 0.04 or less.

The traffic metrics listed above indicate that there are no traffic operational issues at the analyzed intersections. This is a result of the low volume of vehicles at the minor street approach of the intersections.

4.0 Future Background Conditions

4.1 Horizon Years

As described in Section 3.4, Dundalk West Development, west of the Subject Property, is on schedule to be completed and fully occupied by 2020. As a result, the horizon years will consider the full build-out state of the 70 single-detached units as part of the future background traffic. It is otherwise anticipated that the date of full buildout of the Subject Property as well as the Flato North property will be 2030. Thus, the horizon years in the study will consist of 2020 (0% site traffic), 2025 (50% site traffic), 2030 (100% site traffic), 2035 and 2040.

4.2 Growth Rate

Traffic growth rates were calculated based on historical data provided by the Ontario Ministry of Transportation (MTO) publication "Provincial Highways Traffic Volumes, 1998-2010". AADT volumes for the Highway 10 segment adjacent to the Subject Property for the years 2007-2010 were used to calculate an average annual compounded growth rate of 1.08 percent in Highway 10 traffic volumes. For the purposes of conservative analysis, a 1.5 percent growth rate was applied to traffic volumes at all subject intersections.

For the purpose of the traffic operations analysis herein the turning movement counts in March 2016 were modelled as if taken in 2015, and was subject to the same growth as the November 2015 turning movement counts for consistency.

4.3 Future Roadway Improvements

No capacity improvements associated with the subject development have been identified for the boundary roads within the study horizons.

4.4 Background Trip Generation

As previously mentioned, the Draft Plan approved 70-unit Dundalk West Development is currently undergoing detailed design and is anticipated for completion in 2016. As a result, the trips generated by this development will contribute to the future background traffic on the boundary road network and is thus included in the future background traffic analyses.

Table 2 outlines the trip generation per Institute of Transportation Engineers (ITE) Trip Generation Manual, 8th Edition, Land Use Category (LUC) 210 "Single-Family Detached Housing".

Table 2
Future Background Trip Generation

Use	Roadway Peak Hour	Number of Trips		
		Inbound	Outbound	Total
Single-Family Detached Units (LUC 210)	Weekday A.M.	15	44	59
	Weekday P.M.	48	28	76

The trips generated by Dundalk West Development during future background scenarios were distributed on the basis of Transportation Tomorrow Survey Data (TTS) data. The TTS is a comprehensive survey of transportation characteristics of households in the Golden Horseshoe, Simcoe County and Grey County areas. In order to obtain survey data most applicable to the Subject Property, TTS data was filtered as follows:

As data specific to the subject area of Dundalk was unavailable, travel behavior data from the residents of the Township of Melancthon, a town 12 kilometres south of Dundalk, was considered most representative of the subject area and thus used as a surrogate site. The Township of Melancthon was selected as origin and destination for outbound and inbound trips, respectively.

- For the a.m. trips, data was filtered in association with the time at which traffic counts were conducted; i.e., 6:00 a.m. – 10:00 a.m. Similarly, for p.m. trips the time range of 2:00 p.m. – 6:00 p.m. was selected.
- TTS results were restricted to trips made by automobiles with Melancthon as an origin or destination. Trip distribution was determined based on the shortest path of each origin-destination pair. Refer to Appendix D for the TTS Data.
- It was noted that there are no main routes east or west of the Township of Melancthon and thus, all vehicles travelling in these directions would be required to travel approximately five kilometers south to Shelburne in order to travel east or west. As a result, engineering judgement and assessment of existing commuter travel patterns at the subject intersection were used to estimate the proportion of traffic internal trips within Dundalk.

Following the above rationale, this resulted in approximately 30 percent of trips travelling to and from the west via Main Street, approximately 10 percent to and from the east via Main Street, 10 percent of trips to and from the north along Highway 10 and the remaining 50 percent to and from the south on Highway 10. Trips to and from the east, north and south were equally distributed between Osprey Street and Alice Street as based on the Draft Plan approved access to Elm Street.

The trips generated by the proposed development were assigned to the boundary road network per the distributions in Figure 7. The trip assignments for the primary trips are illustrated in Figure 8.

Refer to Figures 5 and 6 for background development trip distribution and trip assignments, respectfully.

The intersection of Main Street and Osprey Street will operate at LOS "B" and "C" through the 2040 future background a.m. and p.m. peak conditions, respectively. In addition, this intersection is expected to experience a control delay of 16.2 seconds or less and volume-to-capacity ratio of 0.08 or less through the 2040 future background scenarios.

5.0 Site Generated Traffic

5.1 Trip Generation

The Subject Property will result in additional vehicles on the boundary road network that previously did not exist. The Subject Property will also result in additional turning movements at the boundary road intersection.

The trip generation of the residential townhomes and single-family units was forecasted using the fitted curve equations provided in the Institute of Transportation Engineers (ITE) Trip Generation Manual, 8th Edition, under Land Use Category 230 "Residential Condominium/Townhomes" and Land Use Category 210 "Single-Family Detached Housing", respectively. Per the initial draft plan dated December 4, 2015 from MHBC Planning the Subject Property is comprised of 194 townhome units and 302 single-family detached units. In addition, per the initial conservatively anticipated 300 single detached unit Flato North development, Land Use Category 210 was also used to estimate the trips generated by this development.

Per the ITE Trip Generation Manual, the proposed residential development is forecasted to generate a total of 309 and 388 trips during the weekday a.m. and p.m. peak periods, respectively for the subject property. In addition, 220 and 283 trips are anticipated post-development of the newly acquired lands.

The updated Draft Plan dated June 3, 2016 (Figure 2) consists of 190 townhouse and 311 single detached residential units. Per the ITE Trip Generation Manual, the updated unit count is forecasted to generate approximately 5 additional trips during the weekday a.m. and p.m. peak periods. The resultant additional trips will not materially affect traffic operations within the boundary road network. As such, the operational analysis undertaken with the above noted trip generation and the results of same remain valid. Moreover the analysis considers the initial upper bound limit of for the north lands.

The forecasted trips as based on the initial December 4, 2015 Draft Plan are tabulated in Table 8.

Table 8
Trip Generation

Subject Property	Use	Roadway Peak Hour	Number of Trips			
			Inbound	Outbound	Total	
Flato East	Residential Townhouse Units (Cat 230)	Weekday A.M.	15	73	88	
		Weekday P.M.	70	34	104	
	Single-Family Detached Units (Cat 210)	Weekday A.M.	55	166	221	
		Weekday P.M.	179	105	284	
Flato North	Single-Family Detached Units (Cat 210)	Weekday A.M.	55	165	220	
		Weekday P.M.	178	105	283	
Total		Weekday A.M.	125	404	529	
		Weekday P.M.	427	244	671	

5.2 Trip Distribution and Assignment

The primary trips generated by the Subject Property were distributed to the boundary roadways based on Transportation Tomorrow Survey (TTS) data as described in Section 4.4. As the Subject Property proposes a site access to Highway 10, as well as the newly acquired Flato North lands proposing a site access to Russell Street, the site generated trips were distributed across the accesses based on anticipated points of access.

Following the above rationale, this resulted in approximately 15 percent of trips travelling to and from the west via the Elm Street access, 15 percent to and from the west via the Russell Street access and five percent each to and from the east and north via the Russell Street access. The remaining five percent each to and from the east and north were distributed via left turn at the Highway 10 site access while the remaining 50 percent of trips to and from the south were distributed via right turn at the Highway 10 site access.

The trips generated by the proposed development were assigned to the boundary road network per the distributions in Figure 12 in addition to the assumed phasing of the Subject Property and Flato North at which 50 percent of the residential units are expected to be completed and occupied by 2025 with full buildout and occupancy expected by 2030. The trip assignments for the primary trips are illustrated in Figure 13.

APPENDIX H

MTO Left-Turn Lane Warrant Charts

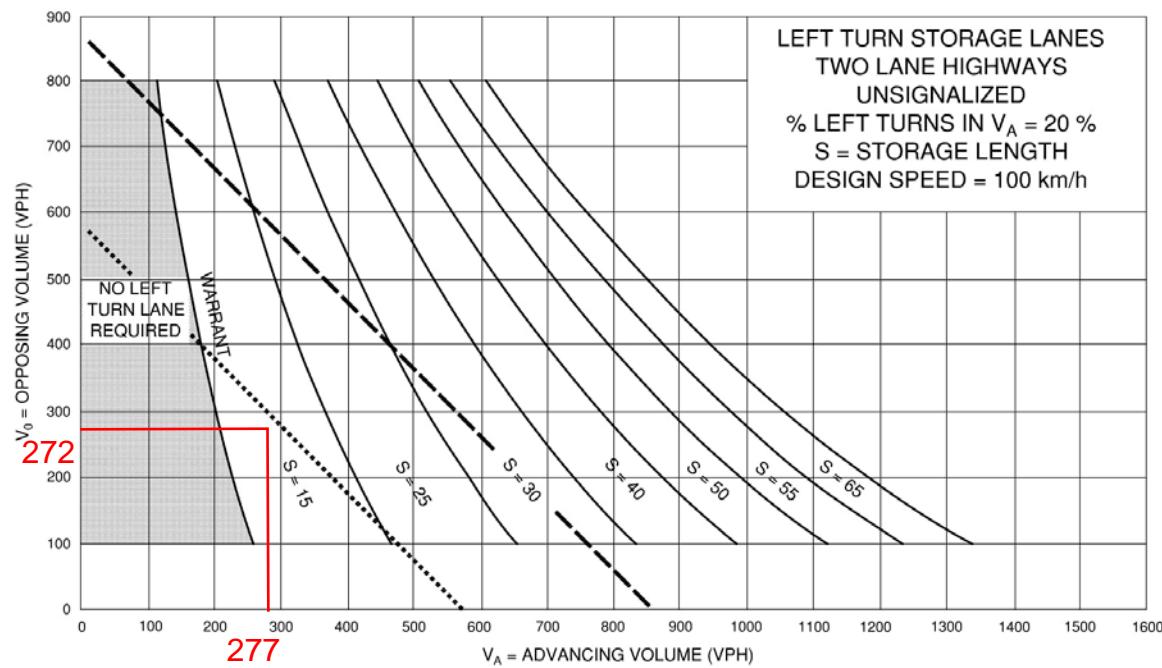

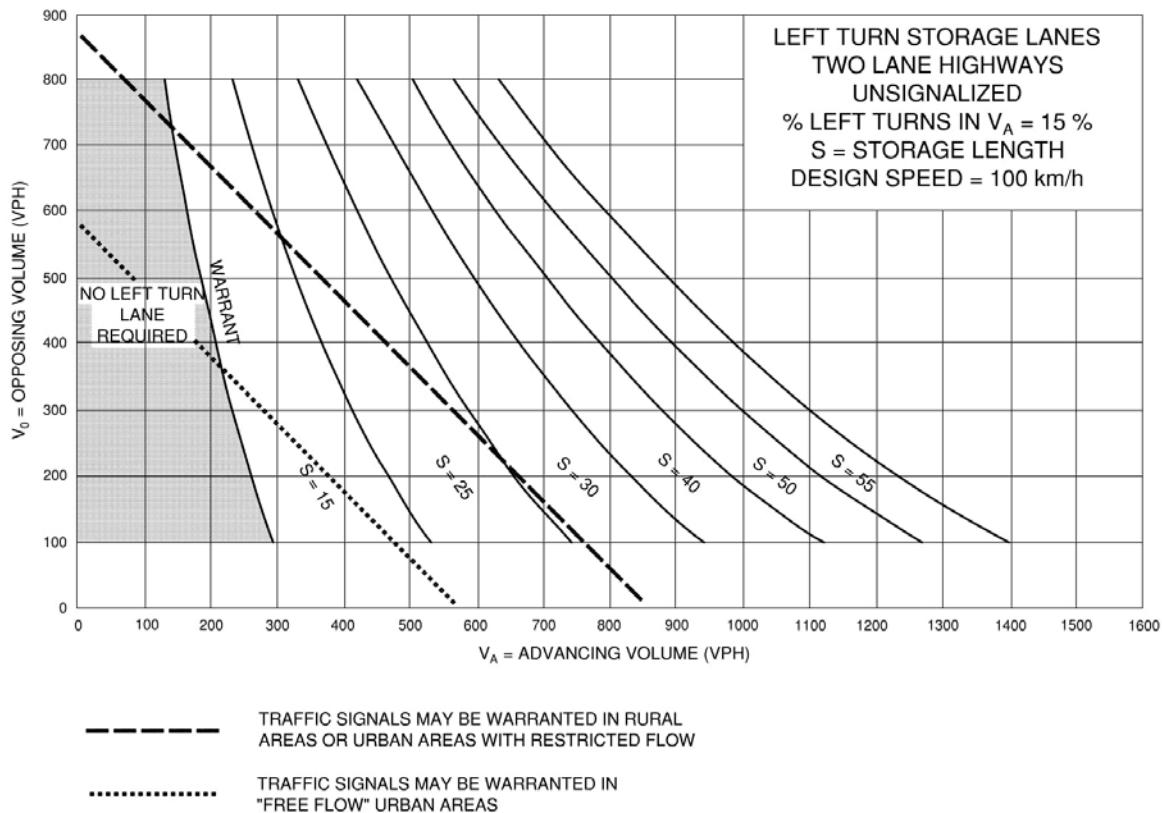

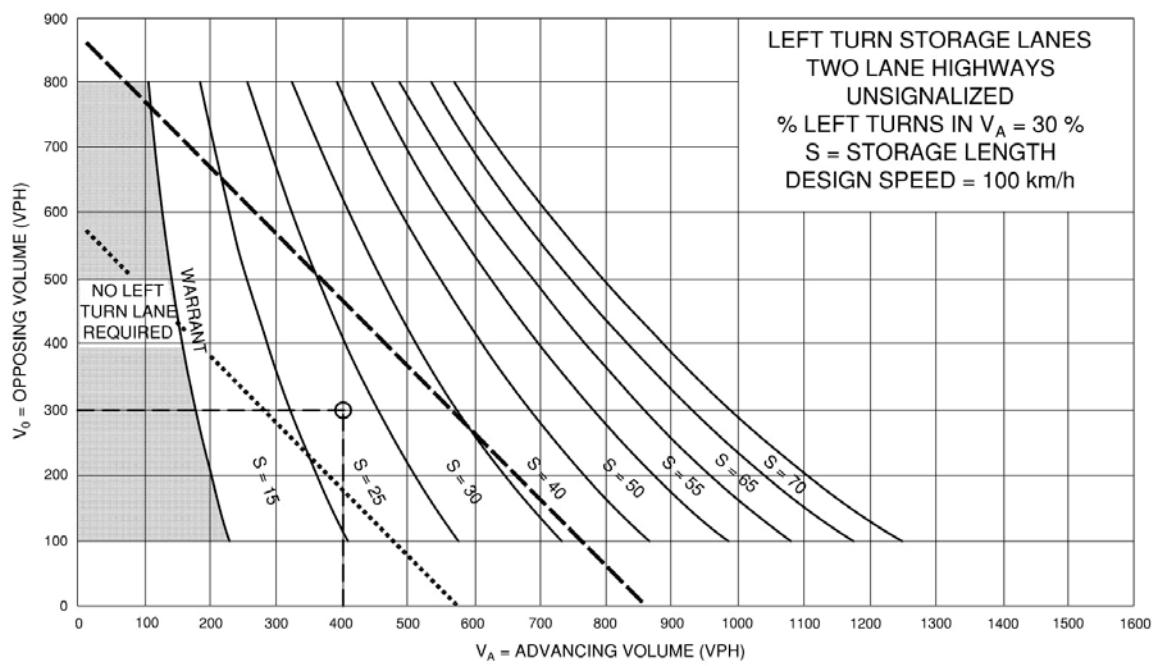

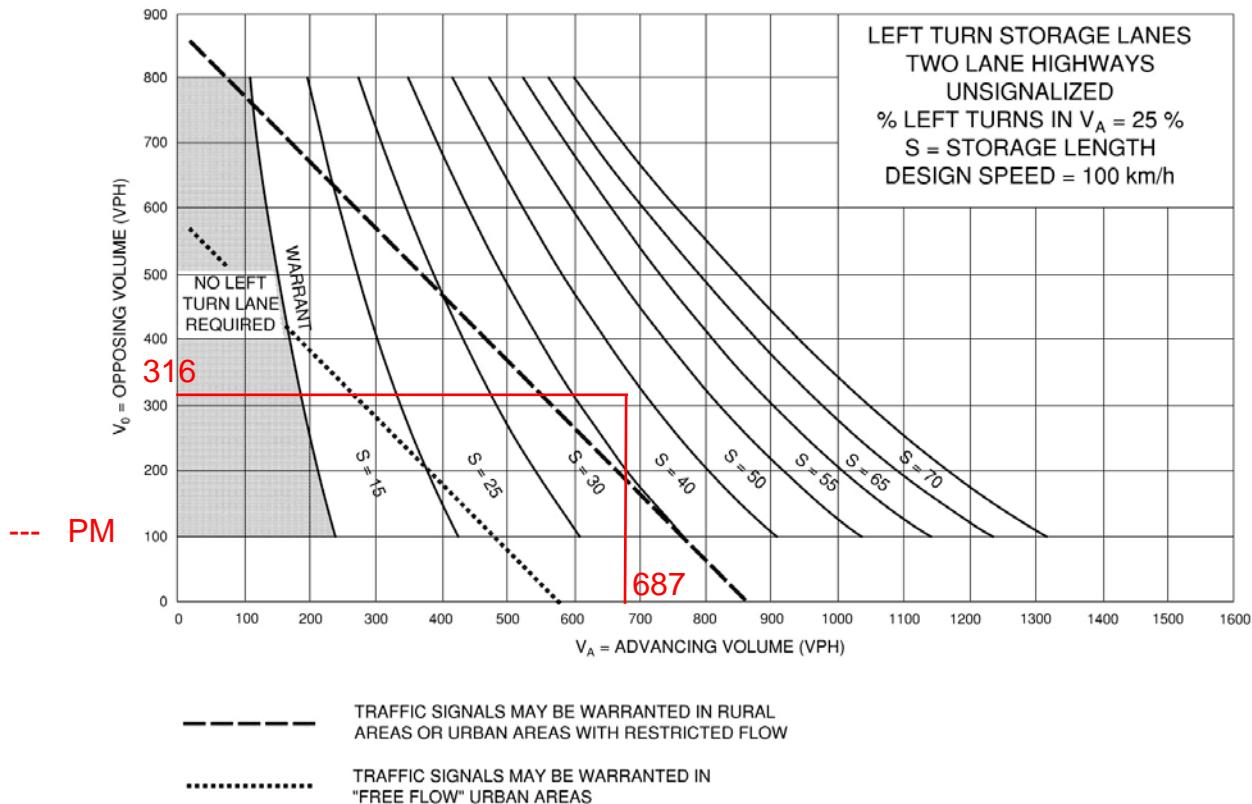

Exhibit 9A-23

Exhibit 9A-24

APPENDIX |

TAC GDGCR Excerpts

Stopping sight distance is the sum of the distance travelled during the perception and reaction time and the braking distance.

$$SSD = 0.278Vt + 0.039 \frac{V^2}{a} \quad (2.5.2)$$

Where:

- SSD = Stopping sight distance (m)
t = Brake reaction time, 2.5 s
V = Design speed (km/h)
a = Deceleration rate (m/s^2)

Table 2.5.2 gives the minimum stopping sight distances on level grade, on wet pavement, for a range of design speeds. These values are used for vertical curve design, intersection geometry and the placement of traffic control devices. The stopping sight distances quoted in **Table 2.5.2** may need to be increased for a variety of reasons related to grade and vehicle type as noted below.

Table 2.5.2: Stopping Sight Distance on level roadways for Automobiles⁵⁴

Design speed (km/h)	Brake reaction distance (m)	Braking distance on level (m)	Stopping sight distance	
			Calculated (m)	Design (m)
20	13.9	4.6	18.5	20
30	20.9	10.3	31.2	35
40	27.8	18.4	46.2	50
50	34.8	28.7	63.5	65
60	41.7	41.3	83.0	85
70	48.7	56.2	104.9	105
80	55.6	73.4	129.0	130
90	62.6	92.9	155.5	160
100	69.5	114.7	184.2	185
110	76.5	138.8	215.3	220
120	83.4	165.2	248.6	250
130	90.4	193.8	284.2	285

Note: Brake reaction distance predicated on a time of 2.5 s; deceleration rate of 3.4 m/s^2 used to determine calculated sight distance.

Table 9.9.3: Time Gap for Case B1, Left Turn from Stop

Design Vehicle	Time Gap (t_g)(s) at Design Speed of Major Road
Passenger car	7.5
Single-unit truck	9.5
Combination truck (WB 19 and WB 20)	11.5
Longer truck	To be established by road authority

Notes: Time gaps are for a stopped vehicle to turn left onto a two-lane highway with no median and with grades of 3% or less. The table values should be adjusted as follows:

- For multi-lane highways: For left turns onto two-lane highways with more than two lanes, add 0.5 s for passenger cars and 0.7 s for trucks for each additional lane, from the left, in excess of one, to be crossed by the turning vehicle.
- For minor approach grades: If the approach grade is an upgrade that exceeds 3%, add 0.2 s for each percent grade for left turns.
- Some road authorities use higher values for certain specialized vehicles (e.g., Alberta uses 22 s for very long log trucks).

The intersection sight distance along the major road (distance b in **Figure 9.9.2**) is determined by:

$$ISD = 0.278 V_{\text{major}} t_g \quad (9.9.1)$$

Where:

ISD = intersection sight distance (length of the leg of sight triangle along the major road) (m)

V_{major} = design speed of the major road (km/h)

t_g = time gap for minor road vehicle to enter the major road (s)

For example, a passenger car turning left onto a two-lane major road should be provided sight distance equivalent to a time gap of 7.5 s in major-road traffic. If the design speed of the major road is 100 km/h, this corresponds to a sight distance of $0.278(100)(7.5) = 208.5$ or 210 m, rounded for design.

A passenger car turning left onto a four-lane undivided roadway will need to cross two near lanes, rather than one. This increases the recommended gap in major-road traffic from 7.5 to 8.0 s. The corresponding value of sight distance for this example would be 223 m. If the minor-road approach to such an intersection is located on a 4% upgrade, then the time gap selected for intersection sight distance design for left turns should be increased from 8.0 to 8.8 s, equivalent to an increase of 0.2 s for each percent grade.

The design values for intersection sight distance for passenger cars are shown in **Table 9.9.4**. **Figure 9.9.4** includes design values, based on the time gaps for the design vehicles included in **Table 9.9.3**.

No adjustment of the recommended sight distance values for the major-road grade is generally needed because both the major- and minor-road vehicle will be on the same grade when departing from the intersection. However, if the minor-road design vehicle is a heavy truck and the intersection is located near a sag vertical curve with grades over 3%, then an adjustment to extend the recommended sight distance based on the major-road grade should be considered.

The time gaps in **Table 9.9.3** can be decreased by 1.0 s for right-turn maneuvers without undue interference with major-road traffic. These adjusted time gaps for the right turn from the minor road are shown in **Table 9.9.5**. Design values based on these adjusted time gaps are shown in **Table 9.9.6** for passenger cars. **Figure 9.9.5** includes the design values for the design vehicles for each of the time gaps in **Table 9.9.5**.

Table 9.9.5: Time Gap for Case B2—Right Turn from Stop and Case B3—Crossing Maneuver

Design Vehicle	Time Gap (t_g)(s) at Design Speed of Major Road
Passenger car	6.5
Single-unit truck	8.5
Combination truck (WB 19 and WB 20)	10.5

Note: Time gaps are for a stopped vehicle to turn left onto a two-lane highway with no median and with grades of 3% or less. The table values should be adjusted as follows:

- For multi-lane highways: For left turns onto two-lane highways with more than two lanes, add 0.5 s for passenger cars and 0.7 s for trucks for each additional lane, from the left, in excess of one, to be crossed by the turning vehicle.
- For minor approach grades: If the approach grade is an upgrade that exceeds 3%, add 0.1 s for each percent grade for left turns.

Case F – Left Turns from the Major Road

All locations along a major highway from which vehicles are permitted to turn left across opposing traffic, including intersections and driveways, should have sufficient sight distance to accommodate the left-turn maneuver. Left-turning drivers need sufficient sight distance to decide when to turn left across the lane(s) used by opposing traffic. Sight distance design should be based on a left turn by a stopped vehicle, since a vehicle that turns left without stopping would need less sight distance. The sight distance along the major road to accommodate left turns is the distance traversed at the design speed of the major road in the travel time for the design vehicle given in **Table 9.9.11**.

Table 9.9.11: Time Gap for Case F, Left Turns from the Major Road

Design Vehicle	Time Gap (t_g)(s) at Design Speed of Major Road
Passenger car	5.5
Single-unit truck	6.5
Combination truck (WB 19 and WB 20)	7.5

Note: Adjustment for multi-lane highways: For turning vehicles that cross more than one opposing lane, add 0.5 s for passenger cars and 0.7 s for trucks for each additional lane to be crossed.

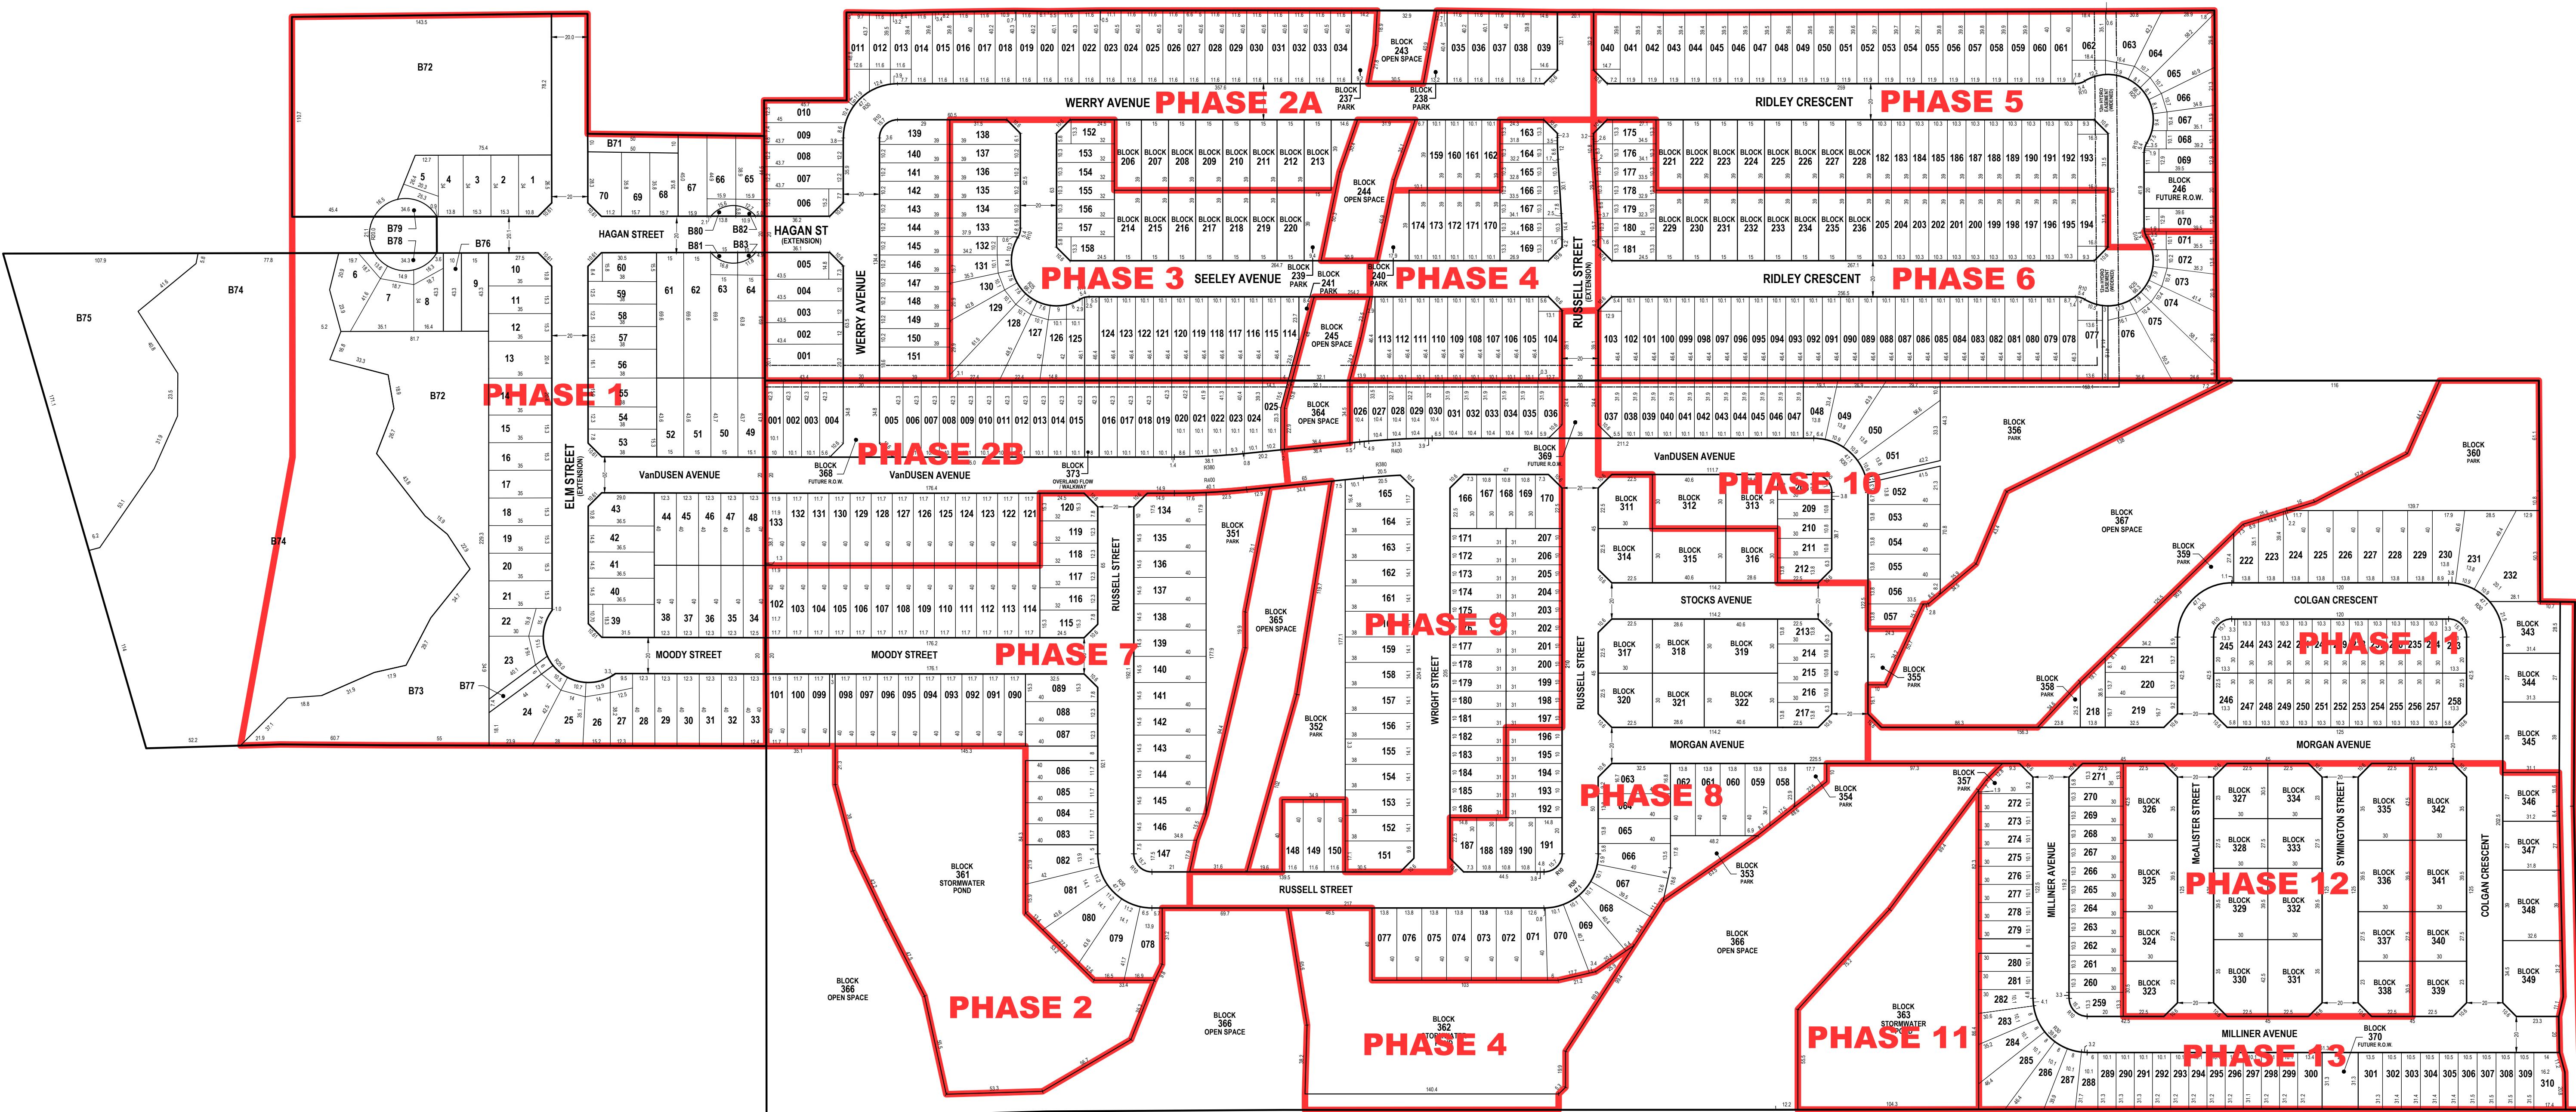

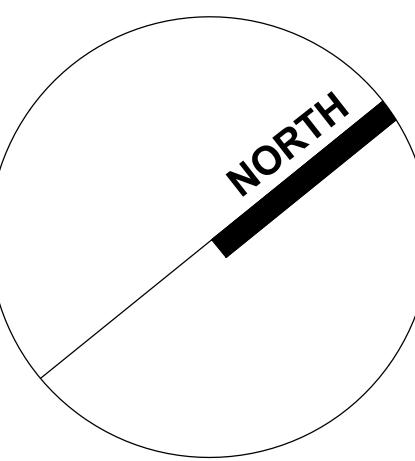

The table also contains appropriate adjustment factors for the number of major-road lanes to be crossed by the turning vehicle. The unadjusted time gap in **Table 9.9.11** for passenger cars was used to develop the sight distances in **Table 9.9.12** and is illustrated in **Figure 9.9.8**.
